

**CLEAN DEVELOPMENT MECHANISM
PROJECT DESIGN DOCUMENT FORM (CDM-PDD)
Version 03 - in effect as of: 28 July 2006**

CONTENTS

- A. General description of project activity
- B. Application of a baseline and monitoring methodology
- C. Duration of the project activity / crediting period
- D. Environmental impacts
- E. Stakeholders' comments

Annexes

- Annex 1: Contact information on participants in the project activity
- Annex 2: Information regarding public funding
- Annex 3: Baseline information
- Annex 4: Monitoring plan
- Annex 5: List of Local Participants in Public Hearing Meeting

**SECTION A. General description of project activity****A.1 Title of the project activity:***Chutak Hydroelectric Project*

Version 10

6 August 2008

A.2. Description of the project activity:

The proposed project activity involves the construction of a hydroelectric run-of-river plant of 44 MW in India. Four turbines of 11 MW will be installed to generate clean and reliable electric power that will be sent to the Northern Grid. As power from the project will displace power generation using fossil fuels elsewhere on the grid, the project activity will lead to a reduction in greenhouse gas emissions.

National Hydroelectric Power Corporation Ltd. (NHPC) will be developing the proposed project activity. NHPC is a Government of India Enterprise that was incorporated in 1975. Its objective is to plan, promote and organise an integrated and efficient development of hydroelectric power in all aspects. Later on NHPC expanded its objectives to include other sources of energy like Geothermal and Tidal among others.

The implementation of the project activity will contribute to

1. The replacement of thermal power generation (from coal and diesel) elsewhere on the grid. This will reduce emissions from fossil fuels combustion.
2. The improvement of basic living conditions (due to availability of electricity) and educational standard (people working on the project will be educated and trained).
3. The economic development of the region.

As a conclusion, the project activity will bring several environmental and socioeconomic benefits thus contributing to the sustainable development of the region.

A.3. Project participants:

Name of Party involved (host) indicates a host Party)	Private and/or public entity(ies) project participants (as applicable)	Kindly indicate if the Party involved wishes to be considered as project participant (Yes/No)
India (host)	National Hydroelectric Power Corporation Ltd. (public)	No

**A.4. Technical description of the project activity:****A.4.1. Location of the project activity:****A.4.1.1. Host Party(ies):**

India

A.4.1.2. Region/State/Province etc.:

Jammu & Kashmir State

A.4.1.3. City/Town/Community etc.:

Minji Village in Kargil District

A.4.1.4. Detail of physical location, including information allowing the unique identification of this project activity (maximum one page):

Jammu and Kashmir State is the northern extremity of India, and is situated between 32.17 degree and 36.58 degree north latitude and 74.26 degree and 80.30 degree east longitude, see Figure 1.

Figure 1: Jammu & Kashmir State in India (light yellow area)

Kargil District, where Chutak Project is located, within Jammu & Kashmir State can be seen in Figure 2.

Figure 2: Location of Kargil District in Jammu & Kashmir

Kargil lies in the north-east of Kashmir Valley at a distance of 224 km from Srinagar. Minji Village is located 6 km from Kargil city centre.

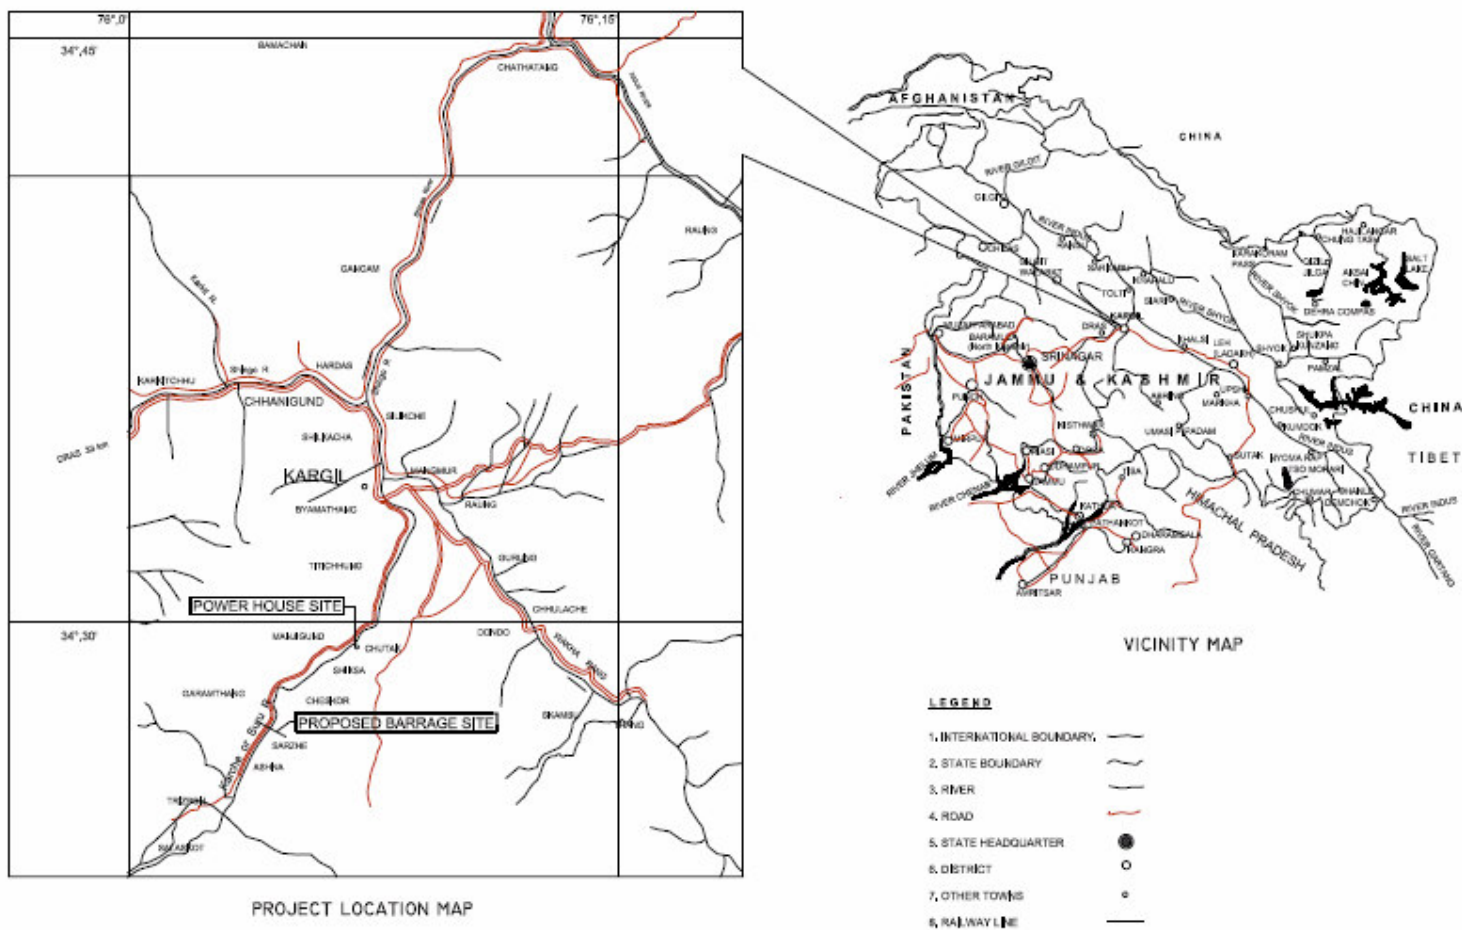

Figure 3: Map of Jammu & Kashmir showing the location of Chutak Hydroelectric Project

**A.4.2. Category(ies) of project activity:**

The most likely category would be: “(1) Energy industries (renewable/non-renewable sources)”

A.4.3. Technology to be employed by the project activity:

Chutak Hydroelectric Project would harness the hydropower potential of river Suru in Kargil district of Jammu & Kashmir. The barrage of the project is located near Sarzhe Village and the power house will be located on the right bank of river Suru near Chutak Village. The project envisages utilizing a gross head of 63.4 m to generate 216.41 GWh in a 90% dependable year with an installed capacity of 44 MW. This is equivalent to a plant load factor (or capacity factor) of 57.2%¹. Each of the four 11 MW generating units will operate under a rated head of 52 m and a rated discharge of 24.05 cubic metres per second.

The expected date of commissioning is February 2011. Technical features of the hydroelectric power station are listed below:

- Barrage: 47.5 m long and 15 m high above crest level.
- Water conductor system consisting of:
 - Two intake tunnels of 4.5 m diameter and 295 m length including cut & cover section.
 - Head Race Tunnel: Horse Shoe shaped 5.9 m diameter and 4,370 m long.
 - Orifice type Underground Surge Shaft: 19 m diameter and 59 m high.
 - Two vertical Pressure Shafts with 3.25 m diameter.
 - Four horizontal Penstocks of 2.3 m diameter & 31 m long each.
- Underground Powerhouse: 4 Francis Turbines of 11 MW each.
- Tail Race Tunnel: Horse Shoe shaped 5.9m diameter and 50m long.
- Switch Yard.

The project is a run-of-river hydro project. The barrage diverts water from the river and involves a flooding of only 0.135 km². Thus the power density is 44 MW per 0.135 km², i.e. very high 326 W/m², compared to dam-based hydroelectric projects².

The turbines would be vertical shaft type (Francis type), with an efficiency of 91.25%. The generator will be vertical shaft suspended type, salient pole type and directly coupled to a turbine. It would be rated for an output of 11 MW at a power factor of 0.90 and rated voltage of 11 KV.

The project will be connected to the Northern Grid by the 220 kV Leh-Srinagar transmission line, which is to be scheduled for commissioning along with project's commissioning.

The hydroelectric project is to be provided with emergency D.G Sets (diesel) to be used when none of the units is operating. This condition is foreseen in case of tripping of the station on fault and not for any routine use. Even during winter season, the station shall run, but on

¹ Calculated as follows: $PLF = (216.41 \times 1000) / (44 \times 8760)$.

²Source: Chapter 2: Salient Features - Detailed Project Report for Chutak Hydroelectric Project.

reduced capacity. The following is the size of D.G. Sets provided at the project: 2x630KVA at Power house (one main and one standby) and 1x500KVA at Barrage.

A.4.4 Estimated amount of emission reductions over the chosen crediting period:

Chutak Hydroelectric Project will reduce an average of 171,456 tCO₂ per year. The following table shows the *ex-ante* estimate of emission reductions for the first 7-year crediting period. Note that actual emission reductions will be based on monitored data and may differ from the estimated ones.

Table 1: Estimated emission reductions during the crediting period

Year	Annual estimation of emission reductions (tonnes of CO ₂ e)
Feb, 2011- Jan, 2012	171,456
Feb, 2012- Jan, 2013	171,456
Feb, 2013- Jan, 2014	171,456
Feb, 2014- Jan, 2015	171,456
Feb, 2015- Jan, 2016	171,456
Feb, 2016- Jan, 2017	171,456
Feb, 2017- Jan, 2018	171,456
Total estimated reductions over the first crediting period	1,200,193
Total number of crediting years	7
Annual average of estimated emission reductions (tCO₂e)	171,456

A.4.5. Public funding of the project activity:

No funds from international multilateral or bilateral assistance will be involved in any aspect of the proposed CDM project activity. No ODA funding is sought.

SECTION B. Application of a baseline and monitoring methodology

B.1. Title and reference of the approved baseline and monitoring methodology applied to the project activity:

The project activity uses an existing consolidated baseline and monitoring methodology. The methodology is designated ACM0002: *“Consolidated methodology for grid-connected electricity generation from renewable sources – version 6”*.

According to the methodology, the assessment of additionality shall be done by applying the “Tool for demonstration and assessment of additionality - version 4.”

**B.2 Justification of the choice of the methodology and why it is applicable to the project activity:**

ACM0002 (version 6) is applicable to grid-connected renewable power generation project activities under the following conditions:

The proposed project activity meets all applicability conditions required by the methodology, as follows:

1. The project involves the construction of a run-of-river hydro power plant. Its power density is 326 W/m^2 (as shown in section A.4.3).
2. The project does not involve switching from fossil fuels to renewable energy at the site of the project activity.
3. The geographic and system boundaries for the Northern Region can be clearly identified and information on the characteristics of the grid is available.

Therefore, the proposed project activity complies with the applicability conditions of the methodology.

B.3. Description of the sources and gases included in the project boundary

The project boundary comprises the physical site of the power plant and the reservoir area. The spatial extent of the project boundary includes the project site and all power plants connected physically to the electricity system that the project is connected to.

Emission sources included in the project boundary are:

	Source	Gas	Included?	Justification / Explanation
Baseline	Electricity Grid	CO ₂	Yes	CO ₂ emissions derived from the Northern Grid of India that will be displaced due to the implementation of the project activity.

As the project power density³ of 326 W/m^2 of flooded area is higher than 10 W/m^2 , project emissions from the reservoir may be neglected, according to EB 23 Annex 5.

³ Source: Chapter 9: Power Plant Electrical and Mechanical Equipment – Detailed Project Report for Chutak Hydroelectric Project.

**B.4. Description of how the baseline scenario is identified and description of the identified baseline scenario:**

As required by the Tool for demonstration and assessment of additionality (version 4), the baseline scenario identification consists of completing three steps. They are analyzed below.

Step 1. Identification of alternatives to the project activity consistent with current laws and regulations***Sub-step 1a. Define alternatives to the project activity***

The identified baseline alternatives are:

Alternative 1. Implementation of the project activity without being registered as a CDM project activity: The project activity would be connected to the public grid and, therefore, displaces an equivalent amount of electricity of the grid mix. This is a possible baseline alternative that is discussed further in Section B.5.

Alternative 2. Continuation of current situation (no project activity implementation): As described in ACM0002 – v.6, for project activities that do not modify or retrofit an existing electricity generation facility, which is the case of Chutak Hydroelectric Project, the baseline scenario is the following:

“Electricity delivered to the grid by the project would have otherwise been generated by the operation of grid-connected power plants and by the addition of new generation sources, as reflected in the combined margin (CM) calculations”.

The proposed power plant is located within the Northern Region Grid. The capacity additions for this Grid are shown in Annex 3 to the PDD. Most of the installed capacity is from thermal plants that use coal or oil as fuel. There are also plants that use natural gas, hydroelectric or nuclear generation.

This is a possible baseline alternative and is discussed further in Section B.5.

Alternative 3. Other renewable generation sources, where an equivalent of electricity would be generated using other renewable energy sources, such as biomass, wind, and solar energy. The project site is a high altitude location, about 4,000 metres above sea level, with very little rainfall. This cold, desert climate provides little biomass resource that is used for food, fodder, and some use as household fuel. There is no surplus biomass resource to generate electricity in this climate, nor any possibilities of biomass plantations. While there are some wind resources in India, none of the favourable locations listed are in Ladakh. (<http://www.windpowerindia.com/statwind2.html>) There are no known wind generators in Ladakh, and certainly no plans for 44 MW installed capacity, equivalent to the proposed hydro project. While there have been some wind farm development in India, especially through the CDM, these are located in the South or West of the country. Electricity can also be generated directly from solar energy through thermal and photovoltaic (PV) routes. Solar thermal electricity generation is not yet a mature technology and there are no large scale installations in India. Solar photovoltaic conversion remains expensive, with virtually no scale economics so that these systems are suitable for supplying small amounts of electricity to locations far from

the power grid. Grid-connected PV systems with installed capacity of 44 MW are far from cost effective compared to other power generation options. Therefore, other renewable sources of energy cannot be considered as plausible baseline alternatives.

Alternative 4. Project proponent implements fossil-fuel fired power plants. The specific project proponent is a company, called National Hydro Power Corporation, which only develops hydro projects. This can be verified in the Memorandum of Association of NHPC, which can be downloaded from their website www.nhpcindia.com from the sub link under management. The main object of the company is listed as “Development of hydroelectric power.”⁴ Thus construction of fossil fuel power plants by the project proponent is not a permissible technological choice or a possible baseline alternative.

“Outcome of Step 1a: Identified realistic and credible alternative scenario(s) to the project activity.”

As alternative 3 faces barriers to its implementation, and alternative 4 is not a permissible option for the project proponent, these cannot be considered as possible baseline alternatives. Then, the remaining alternatives are Alternatives 1 and 2:

Alternative 1. Implementation of the project activity without being registered as a CDM project activity.

Alternative 2. Continuation of current situation (no project activity implementation).

Both Alternatives 1 and 2 are considered further below.

Sub-step 1b. Consistency with mandatory laws and regulations:

The remaining alternative from *sub-step 1.a.* is in compliance with legal requirements as it is the continuation of the current situation.

“Outcome of Step 1b: Identified realistic and credible alternative scenarios to the project activity which are in compliance with mandatory legislation and regulations taking into account the enforcement in the region or country and EB decisions on national and/or sectoral policies and regulations.”

The alternatives remain the same as in sub-step 1.a:

Alternative 1. Implementation of the project activity without being registered as a CDM project activity; and

Alternative 2. Continuation of current situation (no project activity implementation).

“Proceed to Step 2 (Investment analysis) or Step 3 (Barrier analysis). (Project participants may also select to complete both steps 2 and 3.)”

As this analysis is part of the additionality demonstration, it will be conducted in **Section B.5.**

⁴ Note that (a) wind and tidal and (b) geothermal and gas power plants were added in 1998 and 1999 respectively. However, these resources are not available at the project site.

The following table shows all key data used to determine the baseline scenario:

Table 2: Key data

Parameter	Data Sources
Combined margin emission factor	Central Electricity Authority (Official source)
Variables	Data sources
Net electricity generation of the hydroelectric plant per year	NHPC

For further information on key data used for baseline scenario, refer to Annex 3.

B.5. Description of how the anthropogenic emissions of GHG by sources are reduced below those that would have occurred in the absence of the registered CDM project activity (assessment and demonstration of additionality):

As explained in section B.4, the “Tool for demonstration and assessment of additionality” version 4 is used to identify the baseline scenario and to demonstrate the additionality of the project activity. According to **Step 1**, possible alternative baseline scenarios are **Alternative 1: Implementation of the project activity without being registered as a CDM project activity; and Alternative 2: Continuation of current situation (no project activity implementation).**

Alternative 1 implies that the proposed project scenario is indeed the baseline scenario, i.e. it is not additional. As per ACM0002 version 06, the “Tool for the demonstration and assessment of additionality-version 03” has to be applied to demonstrate the additionality of the project, i.e. that Alternative 1 is not a valid baseline scenario. To continue with the assessment of the project’s additionality, Step 2 (investment analysis) and/or Step 3 (barrier analysis) and Step 4 (common practice analysis) are to be applied. The project participant chooses Step 2 followed by Step 4.

Step 2. Investment analysis

Sub-step 2a. Appropriate analysis method

Three methods to perform the investment analysis are presented in the “Tool for demonstration and assessment of additionality”. These are:

- Option I: simple cost analysis
- Option II: investment comparison analysis
- Option III: benchmark analysis

Option I can be used if the project activity generates no financial or economic benefits other than CDM related income, i.e. CERs. This option is not applicable because the proposed project would have revenues from electricity sale as well as CDM revenues.

Investment comparison analysis method (Option II) can only be used if the project and the alternatives to the project activity are all investment projects. However, this option is not applicable to the project because the alternative to the project activity is equivalent annual electricity supplied by the Northern Region Power Grid. The latter alternative is not a new investment project.

Therefore, the only applicable analysis method to the project is benchmark analysis (Option III).

Sub-step 2b. – Option III. Apply benchmark analysis

The additionality tool requires an identification of the most appropriate financial indicator. For the case of a power plant that would supply energy to the grid, the most appropriate indicator is the internal rate of return (IRR). As indicated in the Additionality Tool, version 4, the financial indicator can be based either on (1) project IRR or (2) equity IRR. There is no general preference between the approaches (1) or (2). The benchmark chosen for analysis shall be fully consistent with the choice of approach. The CDM-PDD shall contain clear and transparent arguments to demonstrate how the parameters were derived. We use the project IRR.

Benchmark prime lending rate for public sector banks as of December 2005 (when IRR calculations were made and reported in Table 4 below): 10.25-11.25% (Source: Reserve Bank of India, Annual Report 2005-06, Table 1.58: Movements in Deposit and Lending Rates. <http://rbidocs.rbi.org.in/rdocs/AnnualReport/PDFs/72286.pdf>).

“Table 11.1: Cash Reserve Ratio and Interest Rates : 2005-06” of the same report indicates a PLR range of 10.25 – 10.75%, considering five major banks.

Thus, a benchmark IRR of 10.25% has been chosen as conservative.

Sub-step 2c. Calculation and comparison of financial indicators

The IRR of the project is 6.5%, far below the benchmark IRR. The economic analysis is shown in Table 3.

**Table 3: IRR calculation for Chutak Project**All values in Crore (10^7) Rupees, except for Generation and Sales Rate

Year	OUTFLOW				INFLOW			Net Revenue
	Investment	O&M	W/C	Total	Generation GWh	Sales Rate Rs/kWh	Sales

39	-62.13	9.32	1.71	-51.10	210.38	2.77	58.38	109.48

Internal rate of return

6.50%

**Sub-step 2d. Sensitivity analysis**

The factors that are likely to have an impact in the IRR calculation are:

- ♦ The cost of the project (investment) could be higher due to unforeseen delays in commissioning. It is unlikely to fall, so only increases of 5% and 10% are considered.
- ♦ Electricity sales (revenues) could be higher or lower due to changes in electricity sales rate. Increases and decreases of 5% and 10% in electricity sales rate are considered.
- ♦ Electricity sales (revenues) could also be higher or lower due to changes in power generation as a result of changes in water availability and/or equipment availability. Increases and decreases of 5% and 10% are considered.
- ♦ O & M costs could be higher or lower. Since there is greater uncertainty in O&M rates, increases and decreases of 10% and 20% are considered.

Table 4 shows how variations in those key factors affect the IRR of the project activity. Changes that would reduce project economics are shown in red, while those that would improve project economics are shown in green.

Table 4: Sensitivity analysis for Chutak Hydroelectric Project

Factor					
Project investment change:	+10%	+5%	0%		
Project IRR, %	5.77	6.12	6.50		
Change in electricity sales rate:	+10%	+5%	0%	-5%	-10%
Project IRR, %	7.43	6.97	6.50	6.02	5.52
Change in electricity generation:	+10%	+5%	0%	-5%	-10%
Project IRR, %	7.43	6.97	6.50	6.02	5.52
O&M change:	+20%	+10%	0%	-10%	-20%
Project IRR, %	6.19	6.35	6.50	6.65	6.80

The sensitivity analysis shows that, within the range of variability considered, project economics is more sensitive to changes in revenue. However, even with a 10% increase in revenue, the IRR only rises to 7.43%, far below the benchmark IRR. If capital cost were 35% lower, or if electricity sales rate were 43% higher, IRR would increase to 10.25%, the benchmark value. Even if O&M costs fell to zero, the IRR would only increase to 7.96%. This confirms that the project continues to be not economically attractive without CDM benefits, except in the case of a substantial increase in the electricity sales rate. Since the electricity sales rate is determined by a government agreement at the time of power plant planning stage, and not by market forces, a large increase such as 43% is unlikely in the Indian context. Therefore, the financial unattractiveness of the project is robust to reasonable variations in the critical parameters.

Step 3 (barrier analysis) is not used to demonstrate additionality for this project.

**Step 4. Common practice analysis*****Sub-step 4a. Analyze other activities similar to the proposed project activity:***

The prevailing practice in Indian power investment scene is investing in medium or large scale conventional power projects, as the projects that are arising are mostly large scale fossil fuel-based power generation stations. This is mainly due to a better return on investment, economies of scale and easy availability of finances and fuel resources.

The power generation through renewable energy sources is not common which is evident from the fact that the share of renewable energy generation is only around 4.2%. The energy generation from hydro projects with installed capacity below 50 MW represents only 1.6% of the total generation in Jammu and Kashmir State (where the project is located) as shown in Table 5, and only 0.8% of total generation of the Northern Grid, as shown in Table 6. This confirms that hydro projects such as the proposed project activity are not common practice in the region.

**Table 5. Net Generation (hydro below 50 MW and total)
for Jammu and Kashmir State, for period 2000-2005**
Source: Table 3.3 in Annex 3, based on official data

Average total grid generation during period	30,351	GWh
Average hydro<50MW generation during period	494	GWh
Percentage of hydro<50MW generation over total	1.6%	

**Table 6. Net Generation (hydro below 50 MW and total)
for Northern Region Grid, for period 2000-2005**
Source: Table 3.3 in Annex 3, based on official data

Average total grid generation during period	147,615	GWh
Average hydro<50MW generation during period	1,109	GWh
Percentage of hydro<50MW generation over total	0.8%	

In conclusion, the project activity is not a common practice in the region.

Sub-step 4b. Discuss any similar options that are occurring

There are very few hydro projects below 50 MW within the State of Jammu and Kashmir. All except one of these are substantially smaller, below 15 MW.

As all steps are successfully completed, therefore the proposed project activity is additional.

B.6. Emission reductions:**B.6.1. Explanation of methodological choices:**

The project activity involves the generation of electricity through the construction of a hydroelectric plant. Methodology ACM0002 (version 6) is applied to the proposed project. The

project activity mainly reduces carbon dioxide emissions by displacing other generation sources connected to the electricity grid.

The electrical transmission in India is divided in five regions: Northern Region, North-Eastern Region, Eastern Region, Southern Region and Western Region. The Northern Region comprises Delhi, Punjab, Haryana, Chandigarh, Rajasthan, Jammu and Kashmir, Uttaranchal, Uttar Pradesh and Himachal Pradesh.

Baseline emissions are the product of carbon dioxide grid emission factor for the Northern Region of India (EF in tCO_2/MWh) times the electricity supplied by the project activity to the grid (EG_y) minus the baseline electricity supplied to the grid in the case of modified or retrofit facilities (EG_{baseline} in MWh), as follows:

$$BE_y = (EG_y - EG_{\text{baseline}}) \times EF \quad (1)$$

As this project is a new plant, it does not involve any retrofit, so EG_{baseline} shall not be calculated. As a consequence, equation (1) is:

$$BE_y = EG_y \times EF \quad (1a)$$

The emissions factor EF is determined from two components: an Operating Margin (OM) and a Build Margin (BM). In each case there are alternative procedures specified in ACM0002.

The Simple Operating Margin is applicable for OM when low-cost/must-run constitute less than 50% of the total grid generation, which is the case here.

According to ACM0002 (version 6) it is necessary to choose a calculation criteria for the Simple OM used to calculate the Combined Margin (CM). The options for data vintages are:

- ♦ *(ex-ante) the full generation-weighted average for the most recent 3 years for which data are available at the time of PDD submission, if or,*
- ♦ *The year in which project generation occurs, if $EF_{\text{OM},y}$ is updated based on ex-post monitoring.*

The first option is chosen for the proposed project activity. Thus the value of OM will remain fixed during the first crediting period.

The two options that ACM0002 (version 6) provides to calculate the Build Margin (BM) are:

- ♦ *Option 1: calculate the BM emission factor ($EF_{\text{BM},y}$) ex-ante based on the most recent information available on plants already built for sample group m at the time of PDD submission. The sample group m consists of either the five power plants that have been built most recently, or the power plant capacity additions in the electricity system that comprise 20% of the system generation (in MWh) and that have been built most recently. Project participants should use from these two options, the sample group that comprises the larger annual generation.*
- ♦ *Option 2: for the first crediting period, the BM emission factor ($EF_{\text{BM},y}$) must be updated annually ex-post for the year in which annual project generation and associated emissions reductions occur. For subsequent crediting periods, $EF_{\text{BM},y}$ should*

be calculated ex-ante, as described in option 1 above. The sample group m consists of either the five power plants that have been built most recently, or the power plant capacity additions in the electricity system that comprise 20% of the system generation (in MWh) and that have been built most recently. Project participants should use from these two options that sample group that comprises the larger annual generation.

The project participant chooses Option 1 to conduct the BM calculation. Thus the value of BM will remain fixed throughout the first crediting period.

According to ACM0002 neither project emissions nor leakage effects are to be considered in the emission reductions calculation. Therefore, baseline emissions are equal to emission reductions.

$$ER_y = BE_y (tCO_2 / yr)$$

Where,

ER_y = Emission reductions during year y in tonnes of CO₂ per year.
 BE_y = Baseline emissions during year y in tonnes of CO₂ per year.

Basing on equation (1a), baseline emissions are equal to:

$$BE_y = EG_y \times EF$$

Where,

BE_y = Baseline emissions corresponding to equivalent energy generation from the grid during year y (tCO₂/year)
 EG_y = Electricity generated by the project activity and displaced from the grid during year y (MWh)
 EF = CO₂ emission factor for the electricity grid (tCO₂/MWh)

B.6.2. Data and parameters that are available at validation:

Data / Parameter:	EF
Data unit:	tCO ₂ /MWh
Description:	Carbon dioxide emission factor of the Northern Region electricity grid
Source of data used:	Calculated from official data sources (CEA Database)
Value applied:	0.793 for <i>ex-ante</i> estimate of emission reductions
Justification of the choice of data or description of measurement methods and procedures actually applied :	Calculated according to ACM0002, ver. 6.
Any comment:	Calculation is shown in Annex 3. EF will remain fixed throughout the first crediting period.

**B.6.3 Ex-ante calculation of emission reductions:**

According to ACM0002 version 06 no leakage emissions are to be considered. Project emissions are not envisaged for the proposed project activity, so emission reductions are equal to baseline emissions.

Estimation of Baseline Emissions

Equation (1a) is used to calculate baseline emissions:

$$BE_y = EG_y \times EF$$

Where,

- BE_y = Baseline emissions corresponding to equivalent energy generation from the grid during year y (tCO₂/year)
 EG_y = Electricity generated by the project activity and displaced from the grid during year y (MWh)
 EF = CO₂ emission factor for the electricity grid (tCO₂/MWh)

The estimated electricity generation by the proposed project activity for the chosen crediting period is:

Table 6: Estimated electricity generation

Year	Estimated Electricity Generation (MWh)
Feb, 2011- Jan, 2012	210, 380
Feb, 2012- Jan, 2013	210, 380
Feb, 2013- Jan, 2014	210, 380
Feb, 2014- Jan, 2015	210, 380
Feb, 2015- Jan, 2016	210, 380
Feb, 2016- Jan, 2017	210, 380
Feb, 2017- Jan, 2018	210, 380
Total	1,472, 660

Estimation of Emission Reductions

As indicated above, emission reductions are equal to baseline emissions. Then,

$$ER_y = EG_y \times EF$$

**B.6.4 Summary of the ex-ante estimation of emission reductions:**

The *ex-ante* emission reductions are estimated to be 171,456 tonnes of CO₂ equivalent per year. However, actual emission reductions will be based on monitored data, thus, *ex-post* emission reductions are likely to be different from the *ex-ante* estimate.

Table 7: Estimation of overall emission reductions throughout the crediting period

Year	Estimation of project activity emissions (tCO ₂ e)	Estimation of baseline emissions (tCO ₂ e)	Estimation of leakage (tCO ₂ e)	Estimation of overall emission reductions (tCO ₂ e)
Feb, 2011- Jan, 2012	0	171,456	0	171,456
Feb, 2012- Jan, 2013	0	171,456	0	171,456
Feb, 2013- Jan, 2014	0	171,456	0	171,456
Feb, 2014- Jan, 2015	0	171,456	0	171,456
Feb, 2015- Jan, 2016	0	171,456	0	171,456
Feb, 2016- Jan, 2017	0	171,456	0	171,456
Feb, 2017- Jan, 2018	0	171,456	0	171,456
Total	0	1,200,193	0	1,200,193

B.7 Application of the monitoring methodology and description of the monitoring plan:
--

B.7.1 Data and parameters monitored:

Data / Parameter:	<i>EG_y</i>
Data unit:	MWh
Description:	Net electricity generation by the project activity and displaced from the grid.
Source of data to be used:	NHPC
Value of data applied for the purpose of calculating expected emission reductions in section B.6:	1,472,660 MWh for <i>ex-ante</i> estimate of emission reductions was used. This is the estimated generation for the 7-year crediting period (see table 6).
Description of measurement methods and procedures to be applied:	<p>This value will be measured by using energy meters. The monitored values will be stored in non-volatile memory. These meters are integrated type with storage of data.</p> <p>For monitoring of the generation and transmission of power, a metering system using digital meters and recorders shall be provided for generators, for all lines and feeders of Switchyard, Unit transformers, Station Service Transformers, Step Down transformer etc. All parameters such as voltage, current, power, energy, etc., shall be measured. All the energy meters used for measurements shall have an accuracy of 0.2%. All CT's and PT's shall be provided with a measuring core of accuracy class of 0.2. A system of main meter and check meters both for interface tariff and energy audit shall be provided.</p> <p>Additional information is provided in section B.7.2.</p>
QA/QC procedures to be applied	Since the metering is done at a number of pf points, the method of measurement of power generation is free from errors as several points of check and counter check are available.
Any comment:	Monitored data will be kept for two years after the end of each crediting period or the last issuance of CERs, whichever occurs later.

**B.7.2 Description of the monitoring plan:**

The monitoring of baseline emissions implies the application of an operational and management procedure that shall assure the correct and proper measurement and control of all variables involved in the calculation of emission reductions.

The necessary structure is characterised in the table given below.

Table 8: Operational and management structure

Department	Responsibility	Monitoring	Methodology
Chutak Hydroelectric Project	Head of the Project (HOP)	Net Electricity Generation (EG_y)	<p>Energy meters are provided to measure Power Generation. These are:</p> <ol style="list-style-type: none"> 1. Main Meter for tariff – provided at line terminal. Accuracy of CT, PT, Energy meter 0.2% 2. Check Meter for tariff - provided at line terminal. Accuracy of CT, PT, Energy meter 0.2% 3. Stand-by meter for tariff – provided on HV side of Generator transformer. Accuracy of CT, PT, Energy meter 0.2% <p>The meters are integrated in nature and as per the latest technology and shall provide the following information stored in non-volatile memory:</p> <ul style="list-style-type: none"> ♦ Average frequency for each 15-minutes block (integrated for each 0.02 Hz in linear step). ♦ Net active energy (Wh) for each 15-minutes block with sign (+/-). ♦ Cumulative active energy (Wh) at each mid-night. ♦ Cumulative reactive energy (VARh) each 15-minutes block for low voltage (below 97%) condition. ♦ Meter data storing capacity is 10 days. <p>Meters for energy accounting & audit- provided at HV&LV sides of Unit auxiliary transformer & Station auxiliary transformer. Accuracy of CT, PT, Energy meter 0.2%.</p>
CDM, Cell, NHPC Ltd.	Chief Engineer (CDM)	Follow-up of CDM Project	There will be a person in charge of following the development of the project activity.

Monitoring activities that complement the Maintenance Plan:

Monitoring tests like Partial Discharge of generators, Dissolved Gas Analysis of Transformer oil, Insulation Resistance, capacitance, tan delta tests⁵, and many others are also done to complement the monitoring. Procedures for regular testing and calibration of gauges, panel relays, relays, meters and other instruments are also defined to ensure proper working. The frequency for calibration and other tests are defined as per need following national standards and rules.

Staff Training that complements the Monitoring Plan and Maintenance Plan:

Staff training for proficiency in use of the monitoring instruments is taken care of by the power station management. The HRD cell also conducts training regularly to enhance the skills of personnel attached with such equipment in the operating stations.

The EPC contract includes the supply of the operation and maintenance manuals by the contractor with drawings of the facilities as built. This shall be in such detail as to enable NHPC to operate, maintain, adjust and repair all parts of the facility.

For Chutak specific plans and documents will be available at the time of commissioning of the plant.

Data and Information Management of the plant:

A system shall be provided at central control room that shall be equipped with storage media for real time data storage. The data logger shall be provided to receive, update, print out and show on the VDU's all signals, events, alarms, status, status change, abnormalities and history data of plant and ambient conditions either periodically, on request or immediately in case of alarm.

Redundant Network Attached Storage (NAS) systems of high performance and high capacity to store the plant history data up to the power plant's lifetime shall be provided. The information stored by these storage appliances shall also be available on-line with automatic "hot" backup of on-line data and ready to be shared by servers on the Central Control Room Network and associated LAN. The NAS devices shall have open system architecture to connect them to other equipments. This centralized data storage system shall also use fast read/write optical backup medium such as re-writable CD-RW media using CD writers or high performance tape drives. Storage media is provided for 20 years of storage.

Database Management System based on latest available version of ORACLE RDBMS database software shall be provided.

High reliability of communication shall be realized by double bus (redundant) system. The two systems shall continuously operate separately and only in case of traffic interruption on one bus, the other shall take over the traffic.

⁵ Tan Delta testing enables the cable test engineer to detect insulation defects.

**B.8 Date of completion of the application of the baseline study and monitoring methodology and the name of the responsible person(s)/entity(ies)**

Date of completion of the baseline study: 27/06/2007. Version 10: 06/08/2008.

Baseline and monitoring study prepared by

Florencia Clavin, Gautam Dutt, MGM International Ltda. (Not project participants).

Tel: +54-11-5219-1230

e-mail: fclavin@mgminter.com

SECTION C. Duration of the project activity / crediting period**C.1 Duration of the project activity:****C.1.1. Starting date of the project activity:**

23-09-2006 (Date construction work was awarded to contractor)

C.1.2. Expected operational lifetime of the project activity:

35 years

C.2 Choice of the crediting period and related information:

Renewable crediting period

C.2.1. Renewable crediting period**C.2.1.1. Starting date of the first crediting period:**

01-02-2011

C.2.1.2. Length of the first crediting period:

7 years

C.2.2. Fixed crediting period:**C.2.2.1. Starting date:**

N/A

**C.2.2.2. Length:**

N/A

SECTION D. Environmental impacts**D.1. Documentation on the analysis of the environmental impacts, including transboundary impacts:**

The project is consistent with environmental criteria of the Indian Government. An Environmental Impact Assessment (EIA) has been undertaken for the proposed project activity.

During the public hearing that was conducted to promote the project, the Chief of Environment of NHPC informed the public about the importance of Environmental studies undertaken for this project activity by the Centre for Environmental Education & Training (CEET), University of Jammu. He stressed the importance given to NHPC to conserve the environment in the surroundings of the project area. He said all care has been taken during the EIA studies to protect the interest of local people as well as the environment. The issues evaluated in the EIA are:

- ♦ Physiography and Hydrometeorology
- ♦ Geology
- ♦ Land requirement
- ♦ Floristic and Vegetation types
- ♦ Terrestrial Fauna
- ♦ Aquatic Ecology
- ♦ Soil Characteristics
- ♦ Air Quality
- ♦ Socio-economics

To mitigate the impacts that the project could have on each issue, an Environmental Management Plan (EMP) was designed and included in the EIA.

D.2. If environmental impacts are considered significant by the project participants or the host Party, please provide conclusions and all references to support documentation of an environmental impact assessment undertaken in accordance with the procedures as required by the host Party:

The grievances of people affected by the project have been listened to. As mentioned above, an Environmental Management Plan (EMP) was prepared to mitigate and prevent possible impacts of the project. The measures taken in the EMP are:

- ♦ **Rehabilitation and Resettlement:** families that have to be moved are to be compensated for the loss of their land. Scholarships to meritorious students, infrastructure facilities, irrigation facilities and other programmes are included in the R&R plan.
- ♦ **Afforestation programme:** no forest land is involved in the project construction. An 80 ha area has been proposed to be brought under afforestation.

- ♦ **Catchment Area Treatment (CAT):** An Engineering and biological works are to be undertaken for the CAT Plan.
- ♦ **Biodiversity Conservation Plan:** The Plan consists of two methods: *Ex-situ* Conservation and *In-situ* Conservation. It is also proposed to develop a Biodiversity Park that will include endangered and endemic species.
- ♦ **Reservoir Rim Treatment, Green Belt and Landscaping:** There is an adequate potential for creating a green belt and recreation under the Reservoir Rim Treatment Plan, following Engineering and biological measures, which are based on topography, vegetation, soil types, climate and requirement of protection for the landslides, structures and dwellings.
- ♦ **Restoration of borrow pits area:** This includes construction of retaining walls and stabilization with vegetation cover.
- ♦ **Control of Air and Noise pollution:** Many measures that mitigate air and noise pollution are applied during construction phase. They are listed in the EMP.
- ♦ **Waste disposal plan:** Approximately, 5% of the total generated waste is expected to be used for infrastructural development works of the project. For the rest, three dumping sites were identified near the project area for waste disposal. These will be stabilized with vegetation cover.
- ♦ **Sewage and Solid Waste Management:** A proper sewerage and drainage plan will be designed and a landfill area will be installed for garbage disposal also.
- ♦ **Reservoir Fisheries Development:** To conserve the endemic fish species of Suru River, supplementary stocking has been suggested to augment the existing population. It is recommended not to allow fish catches. It is proposed to develop a fish seed farm near the barrage site with an area of 1 ha for the purpose of reservoir fisheries development.
- ♦ **Fuel Arrangements:** Project contractors should be advised to develop community kitchens at the construction sites and shall only use LPG, kerosene or electricity/solar cookers/pressure cookers.
- ♦ **Health and hygiene:** Sheds are constructed for the workers. They include electricity, ventilation, water supply and community toilets. A mobile health care unit is to be used to visit the stations twice a week.
- ♦ **Disaster management plan:** if a natural disaster occurs it is necessary to have an action plan designed to face that situations.
- ♦ **Environmental monitoring programme:** it includes monitoring of environmental indicators to detect potential problems. An attempt is made to establish early warning of indicators of stress on the environment.

The project Authorities shall send an Annual Progress report of implementation of EMP to Jammu & Kashmir State Pollution Control Board for monitoring.

In addition to the activities of the EMP, various community development works were carried out by the project for welfare of the people living in the region. These include construction of three bridges for the people to cross the rivers (only one was needed to set up the project), free medical treatment for local people, construction of roads, etc. CDM revenues would help in further strengthening such activities.

Regular interaction with stakeholders is done to monitor, share and resolve the environmental and socio-economic issues. A multi-disciplinary committee meets periodically and takes decisions as needed and monitors progress. The multi-disciplinary committees have been constituted including members of various agencies (NHPC Environmental Wing, Ministry of

Environment & Forests, Agriculture Dept., Horticulture Dept, Soil Conservation Dept, Wildlife Dept and NGOs)

SECTION E. Stakeholders' comments

E.1. Brief description how comments by local stakeholders have been invited and compiled:

An Environmental Public Hearing Meeting was performed at Village Sarzhe, District Kargil, on 30th August 2005, as per EIA notification. The main aim of the Public Hearing is to observe the views of public regarding the project.

The public Hearing consisted of several presentations. Specifically, the Chief Engineer of Chutak HE Project described the technical details of the project.

Many important people and general public attended the Public Hearing. They all were asked to give their views on the project because they will be useful for a better development of the project. The following dignitaries/prominent people were present at the meeting:

Table 9: Stakeholders involved in the public hearing

SI No.	Name	Position and Institution or Company
1	Sh. S. K. Sinha	Regional Director, J&KSPCB
2	Jenab Isfandyar Khan	Deputy Commissioner/CEO, LAHDC
3	Sh. Asgar Ali	Superintending Engineer (PDD) J&K
4	Sh. Akhoon Jaffar	Sarpanch, Minji, Panchayat Halqa
5	Sh. Sheikh Hassan	Sarpanch, Kanoor Panchayat Halqa
6	Sh. Mohd Hassan	S/o Moosa, Panch Chutak Halqa
7	Sh. Sheikh Ahmad Mohammadi	R/o Balti Bazar, Kargil
8	Sh. Aga Syed Hadi	R/o Minji
9	Sh. Sneikh Mohd Mohaqiq	R/o Baroo Colony
10	Sh. S.H. Zargar	Chief Engineer, Chutak HE Project, Kargil
11	Sh. Vipin Kumar	Chief (Env.) Region-I, Jammu
12	Haji Mohd Ishaq	Honorable Ex. Councilor, (Rural Development), LAHDC, Kargil
13	Nasir Hussain Munshi	Honorable Ex. Councilor (Works), LAHDC, Kargil
14	Kacho Gulzar Khan	Honorable Ex. Councilor (Agri) LAHDC, Kargil District Panchayat Officer Kargil Assistant Commissioner Development Kargil
15	Sh. Sentil Kumar	IFS, DFO, Kargil

16	Sh. Chaturbhaj Behra	IFS, Kargil
17	Manzoor Ahmad	AEE, J&KSPCB
18	Sh. Khursheed Ahmad Ganie	J&KSPCB
19	Sh. Ravi Sharma	CEET, University of Jammu
20	List of Local Participants enclosed as Annexure 5	

E.2. Summary of the comments received:

All comments were favourable to project development. People are in favour of project construction. All people stressed the environmental responsibility that NHPC has.

However, some people requested NHPC to take into consideration the following suggestions:

- Authorities have to make provisions for safeguarding the land.
- Health care, scholarships for poor children and schools were also emphasized. Local people for employment should be given preference.
- Fences on road sides were also requested. Proper arrangements for maintenance and uninterrupted water supply for irrigation as well as cattle shed for animals were requested.
- There should be a committee of experts to overcome any adverse arising out of the project implementation.
- Air pollution from tunnelling and hygiene should be given due care.

E.3. Report on how due account was taken of any comments received:

EIA & EMP reports along with public hearing report were submitted to Ministry of Environment & Forest (MoEF), New Delhi. The same was discussed by environmental appraisal Committee of MoEF. Based on the recommendations of expert committee, the project was accorded environment clearance by MoEF. All the conditions stipulated in the environmental clearance letter would be complied with.

Suggestions received from the people will be considered and will be given due care. The Chief Engineer of NHPC at Chutak was specially requested to try to minimize the land requirement for the project. It is their duty to fully compensate every family, as the people of villages adjacent to barrage are very poor and agriculture is their main source of livelihood. It was assured that reasonable compensation rates would be provided to people who are likely to be affected/ displaced.

NHPC has given due care in Environmental Management Plan (EMP), for all the issues raised by the public (see Section D.2) above. Furthermore, various social measures proposed in the EMP such as upgrading existing schools, building of community halls, scholarships, etc. were considered. Moreover, priority in employment shall be given to unskilled and semiskilled locals of the area.

Annex 2

INFORMATION REGARDING PUBLIC FUNDING

No funds from multilateral or bilateral development assistance would be used for any aspect of the proposed project activity.

Annex 3

BASELINE INFORMATION

Key data used to estimate the *ex-ante* baseline scenario emissions are given in Table 3.1.

Table 3.1: Key data

Parameters	Value	Data sources
Combined margin emission factor used for <i>ex-ante</i> estimation of ER	0.793 tCO ₂ /MWh	CEA Database
Variables	Value	Data sources
Electricity generation of the industrial facility (7-year period)	1,472,660 MWh	NHPC (Project developer)

Calculation of grid emission factor (EF_y) for Northern Region in India

The Central Electricity Authority (CEA) of India is a statutory organization constituted under Section 3 of the repealed Electricity (Supply) Act, 1948. It was established as a part-time body in the year 1951 and made a full-time body in the year 1975.

As per section 73 of the Electricity Act, 2003, the Central Electricity Authority shall perform certain functions and duties. These functions and duties can be seen in: http://www.cea.nic.in/about_us/functions_cea.html

There is a specific section in their website⁶ where the calculation of the grid emission factor is publicly available. They also provide a *User's guide* for the *CO₂ Baseline Database for the Indian Power Sector*.

According to the *User's guide*:

- ♦ *The Baseline Carbon Dioxide Emissions from Power Sector have been worked out by CEA based on detailed authenticated information obtained from all the operating Power Stations in the country....The Baseline would benefit all prospective CDM project developers to estimate the amount of Certified Emission Reduction (CERs) from any CDM project activity.*
- ♦ *The Indian electricity system is divided into five regional grids, viz. Northern, Eastern, Western, Southern, and North-Eastern. Each grid covers several states. As the regional grids are interconnected, there is inter-state and inter-regional exchange. A small power exchange also takes place with neighbouring countries like Bhutan and Nepal. For each of the five regions, the main emission factors are calculated in accordance with the relevant CDM methodologies.*

For specific assumptions in the calculation please refer to the *User's guide*.

⁶ <http://www.cea.nic.in/planning/c%20and%20e/Government%20of%20India%20website.htm>

The calculation made by CEA is done using ACM0002 version 6, considering data up to fiscal year 2005-06. For calculation of Operating Margin the Simple Method is applied.

The steps followed to calculate the combined margin are synthesized below.

STEP 1: Calculate the Operating Margin emission factor ($EF_{OM,y}$)

The following table shows that LCMR constitute less than 50% of the total grid generation. This is to justify the applicability of the Simple Operating Margin in the Northern Region.

Table 3.2: Share of LCMR resources
(Source: CEA Database)

Share of Must-Run (Hydro/Nuclear) (% of Net Generation)						
	2000-01	2001-02	2002-03	2003-04	2004-05	2005-06
North	25,9%	25,7%	26,1%	28,1%	26,8%	28,1%
East	10,8%	13,4%	7,5%	10,3%	10,5%	7,2%
South	28,1%	25,5%	18,3%	16,2%	21,6%	27,0%
West	8,2%	8,5%	8,2%	9,1%	8,8%	12,0%
North-East	42,3%	42,1%	45,8%	41,8%	55,4%	52,7%
India	19,2%	18,9%	16,3%	17,1%	18,0%	20,1%

Therefore, following option (a) Simple Method, the $EF_{OM,y}$ is given by:

$$EF_{OM,y} = \frac{\sum_{i,j} F_{i,j,y} \times COEF_{i,j}}{\sum_j GEN_{j,y}} \quad (1)$$

Where,

- $F_{i,j,y}$ = Amount of fuel i (in a mass or volume unit) consumed by the relevant power sources j in the year y
- j = Power sources delivering electricity to the grid, not including LCMR and including imports to the grid
- $COEF_{i,j,y}$ = Is the CO_2 emission coefficient of fuel i (tCO_2 /mass or volume unit of the fuel), taking into account the carbon content of the fuels used by relevant power sources j and the percent oxidation of the fuel in year y
- $GEN_{j,y}$ = Is the electricity (MWh) delivered to the grid by source j

The following tables show the generation of the plants connected to the Northern Region of India for each Fiscal Year.

Table 3.3: Net generation of the plants connected to the Northern Region (GWh)
(Source: CEA Database)

The CO₂ emission coefficient $COEF_i$ is obtained as:

$$COEF_i = NCV_i \times EF_{CO2,i} \times OXID_i \quad (2)$$

Where,

EF_i CO₂ emission factor per unit of energy of the fuel i
 $OXID_i$ Oxidation factor of the fuel i
 NCV_i Net calorific value (energy content) per mass or volume unit of a fuel

Since this PDD determines the emissions factor ex ante, to remain unchanged for the first crediting period, the operating margin emissions factor must be calculated from the generation weighted average for the three most recent years for which data are available. The Operating Margin for the most recent three years, for the Northern Region is shown in Table 3.4.

Table 3.4: Operating Margin for recent years and three-year average(tCO₂/MWh)
 (Source: CEA Database)

	2003-04	2004-05	2005-06	Three-year average
North	0.99	0.98	0.99	0.986

STEP 2. Calculate the Build Margin emission factor ($EF_{BM,y}$)

It is calculated as the generation-weighted average emission factor (tCO₂/MWh) of a sample of power plants m , as follows:

$$EF_{BM,y} = \frac{\sum_{i,m} F_{i,m,y} \times COEF_{i,m}}{\sum_m GEN_{m,y}} \quad (3)$$

Where $F_{i,m,y}$, $COEF_{i,m}$ and $GEN_{m,y}$ are analogous to the variables described for the simple OM method above described.

The Build Margin for the most recent year of data (2005-06), for the Northern Region is **0.600** tCO₂/MWh. (Source: CEA Database)

STEP 3. Calculate the baseline emission factor (EF_y)

It is the weighted average of the OM emission factor and the BM emission factor:

$$EF_y = w_{OM} \times EF_{OM,y} + w_{BM} \times EF_{BM,y} \quad (4)$$

The results are shown below:

Table 3.5: Operating margin, Build margin and combined margin for the Northern Region
tCO₂/MWh

Operating margin	0.986
Build margin	0.600
Combined margin	0.793

In compliance to what is expressed in the previous paragraphs of the User's guide, Chutak Hydroelectric Project uses the published emission factor in the CEA website to estimate the baseline emissions.

As Chutak Hydroelectric project is located in the Northern Region then the combined margin emission factor applied in the present project activity is 0.793 tCO₂/MWh.

Annex 4

MONITORING INFORMATION

The Monitoring and Verification Plan describes the procedures followed in order to collect information and auditing required for the project activity development. This plan is necessary to determine and verify emissions reductions achieved by the project activity.

Particularly, this project will require very straightforward collection of data, most of which will be collected by the staff of NHPC where the proposed CDM project is to be implemented.

The Monitoring and Verification Plan (MVP) document fulfills the CDM Executive Board requirements regarding the credibility and accuracy of the monitoring and verification procedures used in CDM projects.

The purpose of these procedures is to manage and support the continuous monitoring process of project performance and periodic auditing, verification and certification activities to determine project outcomes, in particular in terms of greenhouse gas (GHG) emission reductions. The MVP is a vital component of project design and, as such, is subject to a formal third-party validation process —along with the project baseline and other project design features⁷.

Managers of the Project must maintain credible, transparent, and adequate data estimation, measurement, collection, and tracking systems to successfully develop and maintain the proper set of information to undergo an audit for a greenhouse gas (GHG) emission reductions investment. These records and monitoring systems are needed to subsequently allow an Operational Entity to verify project performance as part of the verification and certification process. In particular, this process reinforces the fact that GHG reductions are real and credible to the buyers of the Certified Emissions Reductions (CERs). This set of information will be needed to meet the evolving international reporting standards developed by the UNFCCC.

These guidelines must be followed by the project activity implementers and operators of NHPC. Strict adherence to the procedures set out in this monitoring plan is necessary for the project managers and operators to successfully measure and track project impacts for audit purposes. MGM International will provide capacity building to the Technical Departments of NHPC in order to meet the requirements presented in this MVP.

The methodology applied to this project describes the procedure and equations to calculate emissions reductions from monitored data. For the specific project, the methodology is applied through spreadsheet models. The staff responsible for Project monitoring must complete the electronic worksheets. The spreadsheets automatically provide annual totals in terms of GHG reductions achieved through the project activity.

The models contain a series of worksheets regarding different aspects of emission reductions calculation:

⁷ GHG and other environmental related parameters are monitored and recorded.

- Data entry sheets (*net energy generation*)
- Calculation sheets (*baseline emissions*)
- Result sheet (*emission reductions*)

There are worksheets where the user is allowed to enter data. Even in these sheets, only those cells where the staff of each plant is required to enter data have been left unblocked. All other cells contain model fixed parameters or computed values that cannot be modified by the staff.

A color-coded key is used to facilitate data input. The key for the code is as follows:

- **Input Fields:** Pale yellow fields indicate cells where project operators are required to supply data input, as is needed to run the model;
- **Result Fields:** Green fields display key result lines as calculated by the model.

The last sheet shows the results, comparing year-by-year GHG emissions with the project with baseline values in order to determine annual emission reductions, shown in the last column.

All electronic data will be backed up on a monthly basis.

Annex 5

List of Local Participants in Public Hearing Meeting

Participants list

**J&K State Pollution Control Board
