**SECTION A. General description of small-scale project activity****A.1 Title of the small-scale project activity:****13.25 MW Wind Power Generation by RMTL, in Kutch, Gujarat**

Version: 1.2

Date: 26/03/2009

**A.2. Description of the small-scale project activity:**

The purpose of the project activity is to generate clean and green energy to help combat greenhouse gas emissions from conventional sources of energy. The project activity entails installation of wind turbines having a total capacity of 13.25 MW. Eight wind turbines of 1.5MW each and one wind turbine of 1.25 MW are installed in this project activity. The electricity produced from the wind turbines is exported to the connected state grid barring the entire power generated by the 1.25 MW WTG and 70% of one of the 1.5MW WTG would be wheeled to the project proponent's unit. The project activity is a part of the Western Region (WR) grid. WR grid is predominantly fossil fuel dependent and has a grid emission of 0.898 tCO<sub>2</sub>e/ MWh<sup>1</sup>. The project activity reduces greenhouse gas (GHG) emission in power generation in the grid, which predominantly has fossil fuel based power stations. All the nine wind turbines have been installed in Kutch district in Gujarat state as shown in the table below:

WTG ID Number	Capacity (MW)
SEL/1500/06-07/0358	1.50
SEL/1500/06-07/0359	1.50
SEL/1500/06-07/0360	1.50
SEL/1500/06-07/0361	1.50
SEL/1500/06-07/0382	1.50
SEL/1500/06-07/0383	1.50
SEL/1500/06-07/0384	1.50
SEL/1500/06-07/0362	1.50
SEL/1250/05-06/0139	1.25
<b>Total</b>	<b>13.25</b>

The project proponent, Ratnamani Metals and Tubes Ltd (RMTL), is a well known manufacturer of carbon steel and stainless steel tubes. It employs state-of-the-art technology and caters to the niche markets of almost all the emerging sectors like oil and gas, refineries, petrochemicals, process industries, power plants and water distribution.

The project meets the sustainable development aspects and also contributes its mite to the Government of India's target of meeting its 10% power requirements through renewable energy sources by 2012<sup>2</sup>.

<sup>1</sup> Refer Annex 3 for details of grid emission factor estimation

<sup>2</sup> [www.nri.org/biomass/conference\\_papers/policy\\_material\\_section\\_3.pdf](http://www.nri.org/biomass/conference_papers/policy_material_section_3.pdf) , page 1

## CDM – Executive Board

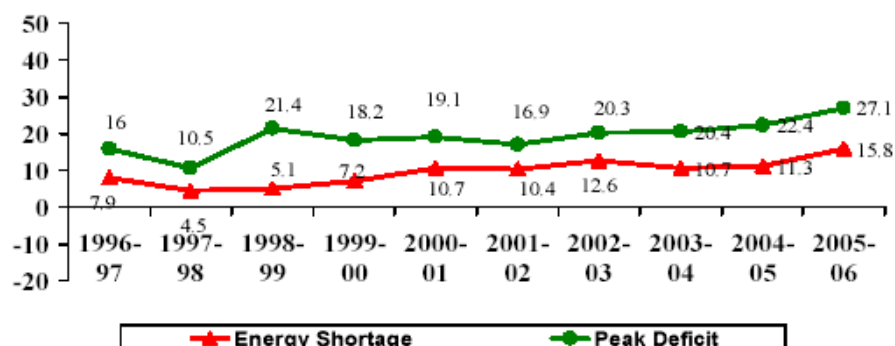

Government of India has stipulated the following indicators for sustainable development in the interim approval guidelines for CDM projects.

**Social well being:**

- The project activity being undertaken is in a rural area of the State of Gujarat. Majority of the population in Kutch district is rural (Census 2001, [www.censusindia.gov.in](http://www.censusindia.gov.in)). Thus such an initiative in the region will promote development of the region as well as lead to improved well being of the society.
- The project activity will help in better connectivity to the wind farms and villages by enabling improved conditions of the roads.
- The project activity will improve economic activities by increasing the electricity generation and availability of power and hence lead to the betterment of the society.
- The project activity will generate employment opportunities for the people, both during construction and operation phases.

The WR grid in India faces power deficit which is approximately 27%<sup>3</sup>. This is a reflection of the fact that power demand is more than power supplied in the states.

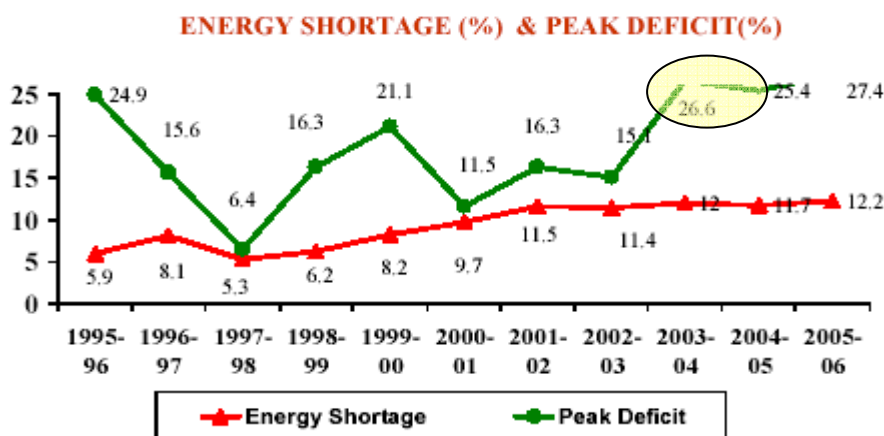

### ENERGY SHORTAGE (%) & PEAK DEFICIT(%) IN WESTERN REGION

A similar situation prevails in the state of Gujarat. It has a peak deficit of ~27% as can be seen from graphs below.

#### Power Demand and Supply state in Gujarat

<sup>3</sup> [Power Sector Profile – Western Region grid](#)

\* On the basis of information submitted to CEA by state agencies

Source: <http://powermin.nic.in>

Power generation using wind-energy would help meet power shortage in the state. It will also contribute towards Government of India's plan of meeting 10% of total power demand in the country using renewable energy sources.

#### Economical well being:

- The project activity would create business opportunity for local stakeholders such as suppliers, manufacturers, contractors etc.
- This initiative would encourage other entrepreneurs from various sectors, to adopt this technology and invest in wind energy.

#### Environmental well being:

- The project activity is a step towards environmental sustainability by avoiding fossil fuels, such as coal, utilized for power generation.
- Since, the project would be using renewable wind resources for power generation; it would not lead to any GHG emissions in the environment.

#### Technological well being:

- The technology selected for the power project is Wind Turbine Generators, manufactured by Suzlon Energy Limited. The technology is latest and environmentally safe.

#### A.3. Project participants:

Name of Party involved (*) ((host) indicates a host Party)	Private and/or public entity(ies) project participants (*) (as applicable)	Kindly indicate if the Party involved wishes to be considered as project participant (Yes/No)
Government of India (Host)	Private entity - Ratnamani Metals	No

CDM – Executive Board

**A.4. Technical description of the small-scale project activity:****A.4.1. Location of the small-scale project activity:****A.4.1.1. Host Party(ies):**

India

**A.4.1.2. Region/State/Province etc.:**

Gujarat

**A.4.1.3. City/Town/Community etc:**

Village: Arikhana, Kamand, Suthri,  
District: Kutch

**A.4.1.4. Details of physical location, including information allowing the unique identification of this small-scale project activity:**

The project activity is located in three villages namely Arikhana, Suthri, Kamand in district, Kutch. Kutch is well connected by road (National Highway No. 15) and also has a domestic airport at Bhuj. It is also connected by railways and the nearest railway station is in Bhuj.

The latitude and longitude of the location of wind mills are given below:

WTG ID number	Capacity (MW)	Village Location	Latitude	Longitude
SEL/1500/06-07/0358	1.50	Suthri	23 03 N	E68 52
SEL/1500/06-07/0359	1.50	Arikhana	23 00 N	E68 55
SEL/1500/06-07/0360	1.50	Arikhana	23 03 N	E68 52
SEL/1500/06-07/0361	1.50	Kamand	23 03 N	E68 52
SEL/1500/06-07/0382	1.50	Suthri-old	23 02 N	E68 53
SEL/1500/06-07/0383	1.50	Suthri	23 02 N	E68 52
SEL/1500/06-07/0384	1.50	Suthri-old	23 02 N	E68 52
SEL/1500/06-07/0362	1.50	Suthri	23 02 N	E68 54
SEL/1250/05-06/0139	1.25	Vanku	22 51N	E68 32
<b>Total</b>	13.25			

The map below shows the location of the district Kutch.

## CDM – Executive Board

#### A.4.2. Type and category(ies) and technology/measure of the small-scale project activity:

The project is a small scale CDM project activity and is based on Appendix B of the simplified modalities and procedures for small-scale CDM project activities. The project activity conforms to the following category -

**Project Type:** I– Renewable Energy Projects

**Project Category:** AMS ID. ‘Grid connected renewable electricity generation’ Version 13, Scope 1, EB 36

The project is a Renewable Energy project with maximum output capacity of 13.25 MW (<15 MW, the maximum output for small scale project); hence, this comes under the Appendix B of the simplified modalities & procedures for small-scale CDM-project activities.

#### **Technology:**

Technical specifications of Suzlon 1500 kW WTG is given below:

Wind Turbine Generator Type	1.5 MW
Make	Suzlon
<b>Rotor</b>	
Rotor Diameter	82.0 m
Cut-in wind speed	4m/s
Rated wind speed	14m/s
Rotor swept area	5281 m <sup>2</sup>
Rotational Speed	16.30 rpm
Rotor material	GRP
Regulation	Pitch
<b>Gear Box</b>	
Type	3 Stage gear box, 1 planetary & 2 helical
Manufacturer	Winergy
Nominal load	1650 kW

## CDM – Executive Board

Type of cooling	Oil cooling system
Gear ratio	95.09
<b>Generator</b>	
Type	Asynchronous generator 4 pole
Rotational Speed	1511 rpm
Rated output	1500 kW
Operational Voltage	690 V
Frequency	50 Hz
Insulation class	Class “H”
Protection	IP 54
Cooling system	Air cooled
<b>Safety system</b>	
Aerodynamic brake	3 times Independent systems pitch regulation
Mechanical brake	Spring powered disc brakes, hydraulically released, fail safe
Control unit	Microprocessor controlled, indicating actual operating conditions, UPS back up system
<b>Yaw Drive System</b>	4 active electrical yaw motors
Yaw bearing	Polyamide slide bearing

Technical specifications of Suzlon 1250 kW WTG is given below.

<b>Wind Turbine Generator Type</b>	<b>1.25 MW</b>
Make	Suzlon, S.64
<b>Rotor</b>	
Rotor Diameter	64 m
Cut-in wind speed	3 m/s
Rated wind speed	14 m/s
Rotor blades	3 no.
Rotor swept area	3217 m <sup>2</sup>
Rotational Speed	13.9 rpm
Rotor material	GRP
Regulation	Pitch regulated
<b>Gear Box</b>	
Type	3 Stage gear box, 1 planetary & 2 helical
Manufacturer	Winergy
Nominal load	1390 kW
Type of cooling	Oil cooling system
Gear ratio	74.917:1
<b>Generator</b>	
Type	Asynchronous generator 4 pole
Rotational Speed	1006/ 1506 rpm
Rated output	250/1250 kW
Rated Voltage	690 V
Frequency	50 Hz
Insulation class	Class “H”
Protection	IP 56
Cooling system	Air cooled

CDM – Executive Board

<b>Safety system</b>	
Aerodynamic brake	3 Independent systems with blade pitch
Mechanical brake	Spring powered disc brakes, hydraulically released, fail safe
Control unit	Microprocessor controlled, indicating actual operating conditions, UPS back up system
<b>Yaw Drive System</b>	4 active electrical yaw motors
Yaw bearing	Polyamide slide bearing

The technology used in the project activity is environmentally safe and sound.

**A.4.3 Estimated amount of emission reductions over the chosen crediting period:**

Year	Estimation of annual emission reduction in tonnes of CO <sub>2</sub> e
2008-09*	23960
2009-10	23960
2010-11	23960
2011-12	23960
2012-13	23960
2013-14	23960
2014-15	23960
2015-16	23960
2016-17	23960
2017-18	23960
<b>Total estimated reductions (tonnes of CO<sub>2</sub>e)</b>	239600
<b>Total number of crediting years</b>	10 years for fixed crediting period
<b>Annual average of estimated reductions over the crediting period (tonnes of CO<sub>2</sub>e)</b>	23960

\*Period: December – November every year

**A.4.4. Public funding of the small-scale project activity:**

No Public Funding for the project activity or funding from Annex 1 or ODA is envisaged for the project activity.

**A.4.5. Confirmation that the small-scale project activity is not a debundled component of a large scale project activity:**

There is no registered small-scale CDM project activity or an application to register another small-scale project activity:

- by the same project participants;
- in the same project category and technology/measure; and
- registered within the previous 2 years; and

## CDM – Executive Board

- whose project boundary is within 1 km of the project boundary of the proposed small-scale activity at the closest point

It therefore satisfies all conditions listed in “Appendix C” of the simplified M&P for the small-scale CDM project activities for guidance on how to determine whether the proposed project activity is not a de-bundled component of a larger project activity”

**SECTION B. Application of a baseline and monitoring methodology**
**B.1. Title and reference of the approved baseline and monitoring methodology applied to the small-scale project activity:**

**Methodology: AMS ID ‘Grid connected renewable electricity generation’ Scope 1**  
Version 13, EB 36

**Methodology: ACM0002 “Consolidated baseline methodology for grid-connected electricity generation from renewable sources”**  
Version 07, Sectoral Scope: 01, EB 36

**“Tool to calculate the emission factor for an electricity system”**  
Version 01, EB 35

**B.2 Justification of the choice of the project category:**

The project status is in line with the methodology AMS ID; specific features of project and applicability of methodology AMS ID are discussed below:

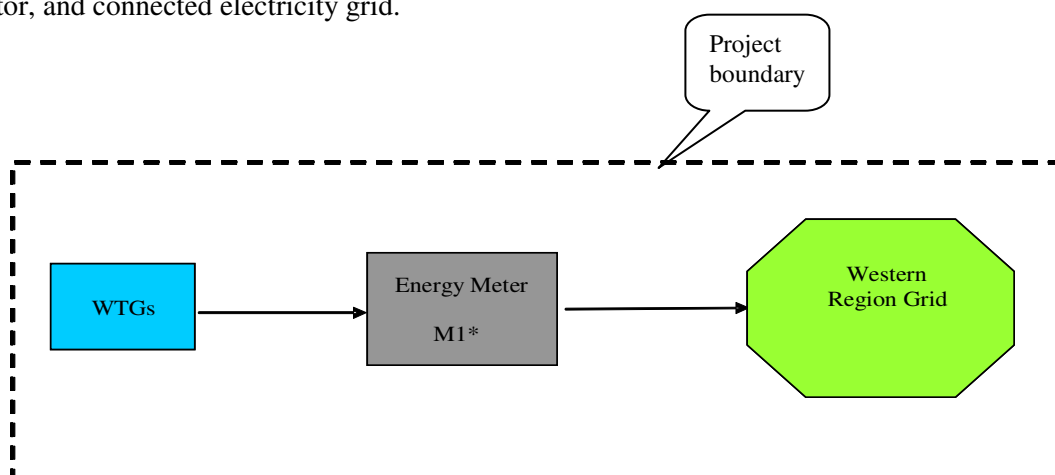

<b>Applicability of AMS ID</b>	<b>Project Status</b>
This category comprises renewable energy generation units, such as photovoltaic, hydro, tidal/wave, wind, geothermal, and renewable biomass, that supply electricity to and /or displace electricity from an electricity distribution system that is or would have been supplied by at least one fossil fuel firing power station	Project activity involves wind energy generating units that supply electricity to the regional distribution system (WR grid) that is supplied by a number of fossil fuel fired units.
If the unit added has both renewable and non renewable components (e.g. a wind/diesel unit), the eligibility limit of 15MW for a small-scale CDM project activity applies only to the renewable component.	The project has only renewable components and the capacity is less than 15MW (13.25 MW).
Combined heat and power (co-generation) systems are not eligible under this category.	The project is not a heat & power generation project. The only output from a wind installation is electricity
In the case of project activities that involve the	Not applicable, all the windmills are new and this

## CDM – Executive Board

addition of renewable energy generation units at an existing renewable power generation facility, the added capacity of the units added by the project should be lower than 15 MW and should be physically distinct from the existing units.	project is not capacity enhancement or up gradation project
Project activities that seek to retrofit or modify an existing facility for renewable energy generation are included in this category. To qualify as a small scale project, the total output of the modified or retrofitted unit shall not exceed the limit of 15 MW	Not applicable, this project is not a retrofit or modification of existing facility.

**B.3. Description of the project boundary:**

The project boundary consists of the Wind Turbine Generator (WTG), the metering equipments for each generator, and connected electricity grid.

\* M1 is explained in the monitoring plan in Annex 4

**B.4. Description of baseline and its development:**

The methodology AMS-ID suggests that, for all other systems, the baseline is the kWh produced by the renewable generating unit multiplied by an emission coefficient (measured in kg CO<sub>2</sub>e/kWh) calculated in a transparent and conservative manner as:

(a) A combined margin (CM), consisting of the combination of operating margin (OM) and build margin (BM) according to the procedures prescribed in the 'Tool to calculate the emission factor for an electricity system'.

OR

(b) The weighted average emissions (in kg CO<sub>2</sub>e/kWh) of the current generation mix. The data of the year in which project generation occurs must be used.

Calculations must be based on data from an official source (where available) and made publicly available.

## CDM – Executive Board

Baseline for the project activity is power generated from renewable energy source multiplied by the grid emission factor of WR grid calculated in transparent and conservative manner.

**Option (a) has been considered to calculate the grid emission factor as per the** 'Tool to calculate the emission factor for an electricity system' as per the methodology as data is available from an official source.

### Baseline Methodology Procedure

Project participants shall apply the following six steps:

STEP 1. Identify the relevant electric power system.

STEP 2. Select an operating margin (OM) method.

STEP 3. Calculate the operating margin emission factor according to the selected method.

STEP 4. Identify the cohort of power units to be included in the build margin (BM).

STEP 5. Calculate the build margin emission factor.

STEP 6. Calculate the combined margin (CM) emissions factor.

### **STEP 1. Identify the relevant electric power system :**

The tool defines the *electric power system* as the spatial extent of the power plants that are physically connected through transmission and distribution lines to the project activity and that can be dispatched without significant transmission constraints. Keeping this into consideration, the Central Electricity Authority (CEA)<sup>1</sup>, Government of India has divided the Indian Power Sector into five regional grids (see table below).

Northern	Western	Southern	Eastern	North-Eastern
Chandigarh	Chhattisgarh	Andhra Pradesh	Bihar	Arunachal Pradesh
Delhi	Gujarat	Karnataka	Jharkhand	Assam
Haryana	Daman & Diu	Kerala	Orissa	Manipur
Himachal Pradesh	Dadar & Nagar Haveli	Tamil Nadu	West Bengal	Meghalaya
Jammu & Kashmir	Madhya Pradesh	Pondicherry	Sikkim	Mizoram
Punjab	Maharashtra	Lakshadweep	Andaman-Nicobar	Nagaland
Rajasthan	Goa			Tripura
Uttar Pradesh				
Uttaranchal				

Since the project supplies electricity to the Western grid, emissions generated due to the electricity generated by the western regional grid as per CM calculations will serve as the baseline for this project. The Western Region grid managed by Western Region Electricity Board (WREB) constitutes five states

## CDM – Executive Board

(viz Maharashtra, Madhya Pradesh, Chhatisgarh, Gujarat and Goa) and two Union territories (Daman & Diu and Dadra & Nagar Haveli). These States under the regional grid have their own power generating stations as well as centrally shared power-generating stations.

**STEP 2. Select an operating margin (OM) method.**

The calculation of the operating margin emission factor ( $EF_{OM,y}$ ) is based on one of the following methods:

- (a) Simple OM, or
- (b) Simple adjusted OM, or
- (c) Dispatch data analysis OM, or
- (d) Average OM.

Any of the four methods can be used. However, the simple OM method (option a) can only be used if low-cost/must-run resources<sup>3</sup> constitute less than 50% of total grid generation in: 1) average of the five most recent years, or 2) based on long-term averages for hydroelectricity production.

Generation	2002-03	2003-04	2004-05	2005-06	2006-07	Average of the last five years
Total Power generation (GWh)	164448	159780	170726	176003	185493	856450
Low cost/ Must run sources (GWh)	13559	14516	14994	21085	25812	89966
% of Low cost/ Must run sources	8.2%	9.1%	8.8%	12.0%	13.9%	10.4%

Source: <http://www.cea.nic.in/planning/c%20and%20e/Government%20of%20India%20website.htm>

The above table clearly shows that the percentage of total grid generation by low-cost/must-run plants (on the basis of average of five most recent years) for the Western regional grid is only 10.4%, which is much lesser than 50% of the total generation. Thus, Simple OM method can be used for calculating the emission factor.

**STEP 3. Calculate the operating margin emission factor according to the selected method.**

For the simple OM, the simple adjusted OM and the average OM, the emissions factor can be calculated using either of the two following data vintages:

- Ex ante option: A 3-year generation-weighted average, based on the most recent data available at the time of submission of the CDM-PDD to the DOE for validation, without requirement to monitor and recalculate the emissions factor during the crediting period, or

## CDM – Executive Board

- Ex post option: The year in which the project activity displaces grid electricity, requiring the emissions factor to be updated annually during monitoring. If the data required to calculate the emission factor for year  $y$  is usually only available later than six months after the end of year  $y$ , alternatively the emission factor of the previous year ( $y-1$ ) may be used. If the data is usually only available 18 months after the end of year  $y$ , the emission factor of the year proceeding the previous year ( $y-2$ ) may be used. The same data vintage ( $y$ ,  $y-1$  or  $y-2$ ) should be used throughout all crediting periods.

The simple OM emission factor is calculated as the generation-weighted average CO<sub>2</sub> emissions per unit net electricity generation (tCO<sub>2</sub>/MWh) of all generating power plants serving the system, not including low-cost / must-run power plants / units.

**Method adopted for Simple OM in the project activity:**

In the project activity, (*ex-ante*) the full generation-weighted average for the most recent 3 years for which data are available at the time of PDD submission has been considered. The data is published annually by the Central Electricity Authority. The CEA database is based on the methodology ACM0002 version 7.

It is confirmed that ex-ante vintage is considered in the project activity and cannot be changed during the crediting period.

Parameter	Value (tCO <sub>2</sub> /MWh)	Source
Simple OM, 2004-05	1.01	The OM is based on ACM0002 version 7 as calculated in CEA database for grid emission factor. <a href="http://www.cea.nic.in/planning/c%20and%20e/user_guide_ver3.pdf">http://www.cea.nic.in/planning/c%20and%20e/user_guide_ver3.pdf</a>
Simple OM, 2005-06	1.00	
Simple OM, 2006-07	0.99	
<b>Simple OM, average</b>	<b>1.00</b>	

**STEP 4. Identify the cohort of power units to be included in the build margin (BM).**

The value of the data has been taken from the data published by CEA as referred in earlier step. The CEA Baseline Database has been calculated as per the methodology ACM0002 and the details of the key assumptions considered to calculate the figure can be found in the User Guide of the same.

Project participants can choose one of the following two options:

*Option 1*

Calculate the Build Margin emission factor  $EF_{BM,y}$  **ex-ante** based on the most recent information available on plants already built for sample group  $m$  at the time of PDD submission. The sample group  $m$  consists of either the five power plants that have been built most recently or the power plant capacity additions in the electricity system that comprise 20% of the system generation (in MWh) and that have been built most recently. Project participants should use from these two options that sample group that comprises the larger annual generation.

## CDM – Executive Board

*Option 2*

For the first crediting period, the Build Margin emission factor  $EF_{BM,y}$  must be updated annually ex-post for the year in which actual project generation and associated emissions reductions occur. For subsequent crediting periods,  $EF_{BM,y}$  should be calculated ex-ante, as described in option 1 above. The sample group  $m$  consists of either the five power plants that have been built most recently or the power plant capacity additions in the electricity system that comprise 20% of the system generation (in MWh) and that have been built most recently. Project participants should use from these two options that sample group that comprises the larger annual generation.

**STEP 5. Calculate the build margin emission factor ( $EF_{grid, BM, y}$ )**

Option 1 as described above is chosen in the project activity. BM is calculated ex-ante based on the most recent information available at the time of submission of PDD and is fixed for the entire crediting period.

As per the CEA CO<sub>2</sub> Baseline Database, the BM for the 2006-07 has been calculated to be  $EF_{grid, BM, y} = 0.59 \text{ tCO}_2\text{e/MWh}$

**STEP 6. Calculate the combined margin (CM) emissions factor ( $EF_{grid, CM, y}$ )**

The CM can be calculated as per the following:

$$EF_{grid, CM, y} = EF_{grid, OM, y} \times W_{OM} + EF_{grid, BM, y} \times W_{BM}$$

Where:

$EF_{grid, OM, y}$  = Build Margin CO<sub>2</sub> emission factor in the year  $y$  (tCO<sub>2</sub>/GWh)

$EF_{grid, BM, y}$  = Operating Margin CO<sub>2</sub> emission factor in the year  $y$  (tCO<sub>2</sub>/GWh)

WOM = Weighting of operating margin emission factor (%)

WBM = Weighting of build margin emission factor (%)

Owing to their intermittent and non-dispatchable nature, the default weights for wind and solar projects are as follows:  $w_{OM} = 75\%$  and  $w_{BM} = 25\%$

In the project activity, **combined margin has been chosen as the baseline emission factor** for grid emission factor. The value chosen is taken from relevant official sources and is publicly available<sup>4</sup>.

Parameter	Value (tCO <sub>2</sub> / MWh)
OM, Operating Margin	1.00
BM, Build Margin	0.59
<b>CM, Combined Margin</b>	<b>0.898</b>

Thus, the CM emissions factor ( $EF_{grid, CM, y}$ ) for the project has been calculated to be  **$EF_{grid, CM, y} = 0.898 \text{ tCO}_2\text{e/MWh}$**  and is fixed ex-ante for the entire crediting period.

<sup>4</sup> [http://www.cea.nic.in/planning/c%20and%20e/user\\_guide\\_ver3.pdf](http://www.cea.nic.in/planning/c%20and%20e/user_guide_ver3.pdf)

**B.5. Description of how the anthropogenic emissions of GHG by sources are reduced below those that would have occurred in the absence of the registered small-scale CDM project activity:**

The project activity is a clean energy project and reduces anthropogenic emissions of greenhouse gases below those that would have occurred in absence of the proposed CDM project activity. It is located in Kutch district of Gujarat. It is a small scale project. Hence, the additionality of the project can be established through any one of the barriers listed in Attachment A to Appendix B.

The methodology lists four barriers, viz.,

- a) Investment barrier
- b) Technological barrier
- c) Barrier due to prevailing practice and
- d) Other barriers.

Subsequently, in its 35<sup>th</sup> Meeting, EB issued Non-binding best practice examples for demonstrating additionality for SSC project activities, wherein the EB has once again reiterated that project participants have to provide an explanation to show that the project activity would not have occurred anyway due to *at least one of the* barriers.

Of the barriers listed above, PP has chosen to demonstrate the additionality through investment barrier, barrier due to prevailing practices and other barriers.

The State of Gujarat has a long<sup>5</sup> coastline of 1600 km with adequate wind speed for generation of electrical energy. The gross wind energy potential of the State has been estimated at 7362 MW.

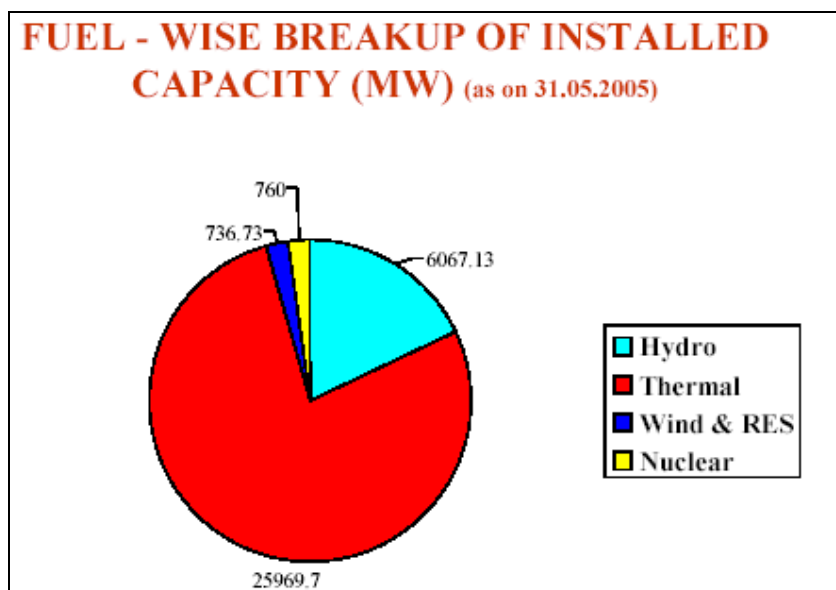

Presently, coal based power plants contribute approximately 77% <sup>6</sup>towards the total power generation in the Western Region, while non-conventional sources of energy contribute less than 2.5% <sup>7</sup>of the total annual generation in the WR grid. In the absence of the proposed project activity, equivalent power would be generated by grid connected power stations and no emission reduction would take place. Government of India plans to generate at least 10% of the total power generation through renewable sources of power by 2012<sup>8</sup> and to achieve the target provides a number of incentives to these projects. The fact that these projects are still offered incentives goes to prove that wind power projects are not common practice. The present break up of the power generation in the country is given in the following chart.

(Source: [http://powermin.nic.in/indian\\_electricity\\_scenario/pdf/WR0505.pdf](http://powermin.nic.in/indian_electricity_scenario/pdf/WR0505.pdf))

Even though investment in wind power project is not financially attractive, project proponents have decided to go ahead with the project, after taking into consideration the CDM benefits likely to accrue, with a view to contributing to the environmental protection.

#### Investment Barrier:

The project proponent has chosen benchmark analysis to demonstrate the additionality of the project, which is sought to be compared with the financial indicator, project Internal Rate of Return (IRR).

Though not required, by virtue of the project being a small scale project activity, the PP has relied on the benchmark suggested by the Additionality Tool, Version 5. The Additionality Tool states that the Discount rates and benchmarks, shall be derived from, *inter alia* Government bond rates, increased by a suitable risk premium to reflect private investment and/or the project type, as substantiated by an independent (financial) expert or documented by official publicly available financial data.

As per the methodology, the benchmark can be derived from Government Bond rates by adding suitable risk premium to reflect private investment and/or project type. The PP has depended on the Reserve Bank of India Annual Report to derive the bond rate. The Reserve Bank of India publishes Annual Report every year wherein the YTM (which is nothing but the bond rate) of bonds are published. The weighted average yield of bond for the year 2005 (upto August 2005), relevant to the year in which decision to invest in the project was taken was 7.28%<sup>9</sup>.

Three research articles have been published on the equity risk premium for Indian Stock Markets, viz.,

<sup>9</sup> <http://rbidocs.rbi.org.in/rdocs/AnnualReport/PDFs/65526.pdf> page 155

## CDM – Executive Board

- a) The Equity Premium in India by *Rajnish Mehra*, University of California, Santa Barbara and National Bureau of Economic Research<sup>10</sup>, and
- b) A First Cut Estimate of the Equity Risk Premium in India by *Prof. Jayant R. Verma and Samir K. Barua*, Indian Institute of Management, Ahmedabad<sup>11</sup>
- c) Cost of Capital for Central Sector Utilities, CRISIL Advisory Services<sup>12</sup>.

While Prof. Rajnish Mehra has estimated the risk premium at 9.7%, Prof. J.R. Verma has placed it 8.75%. CRISIL has estimated the risk premium at 8.20%. However, this return represents the risk premium for investing in the *stock market* as the authors have taken Sensex as a proxy for market return. The methodology requires the risk premium added should reflect private investment and/or the project type. From the above, as a conservative approach, the lowest market risk premium of 8.20% has been chosen.

The CAPM states that the excess of expected return on *any stock* over the risk free rate is equal to the equity risk premium times the *riskiness of the stock as measured by its beta*<sup>13</sup>. In the case of new projects, beta value will not be available. Therefore, the only option to estimate the risk premium of the project is to go by the beta value of similar existing listed projects. Among the power projects listed in the Indian stock exchanges, BF Utilities Ltd. is the only wind power project comparable to the project under consideration. The beta value of BF Utilities has been computed based on the data publicly available from BSE Website. A period of three year, i.e., from January 2003 to December 2005 has been taken into account to compute the beta value. The beta works out to 2.155.

Based on the equity beta, debt-equity ratio and the tax rate<sup>14</sup> of BF Utilities Ltd. the Asset Beta has been arrived at using the following formula:

$$\text{Asset beta} = \text{Equity beta} / [(1 + (1 - T_c) * D/E)]$$

Asset Beta works out to 1.48. Since Asset Beta is an unlevered beta, the underlying assumption is that it is an all equity firm. In other words, it is the risk premium for this project type, i.e., the premium the project developers expect from such projects. Since this figure represents the risk premium expected of a project type, the risk premium together with the Government Bond rates represent the benchmark, which is comparable to project IRR<sup>15</sup>.

<sup>10</sup> <http://www.academicwebpages.com/preview/mehra/pdf/Equity%20Premium%20in%20India.pdf>

<sup>11</sup> <http://www.iimahd.ernet.in/~jrvarma/papers/WP2006-06-04.pdf>

<sup>12</sup> *Cost of Capital for Central Sector Utilities*, CRISIL Advisory Services can be accessed at <http://cercind.gov.in/rep1304.pdf>

<sup>13</sup> *Prof. Jayant R. Verma and Samir K. Barua*, A First Cut Estimate of the Equity Risk Premium in India Indian Institute of Management, Ahmedabad

<sup>14</sup> The debt equity ratio of BFU as on 30-9.2005 (relevant to the period in which decision was taken) was 0.755 and the tax rate was 39.75%. Relevant data are available at the website <http://www.moneycontrol.com/india/stockpricequote/powergenerationdistribution/bfutilities/16/38/profitloss/marketprice/BFU>

<sup>15</sup> Factoring in project's financial structure would render the risk premium lose its characteristic as the risk premium of the project type; instead it would become risk premium of the project.

## CDM – Executive Board

A conservative approach has been adopted to estimate the risk premium for the project type and the beta value has been taken at 0.75 only<sup>16</sup>. Thus, taking into account risk premium of the project type, the risk premium estimated by CRISIL (8.20 X 0.75) and the Government bond rate (7.28%), the benchmark works out to 13.43%. A certificate on the calculation of beta – sources of data, method of calculation and the arithmetical accuracy thereof and the appropriateness of the Government bond value selected from a financial expert is enclosed.

The PP has chosen the financial indicator - project IRR, to demonstrate the additionality. The project IRR is compared to the Benchmark to establish the additionality of the project activity. Following assumptions have been made for estimation of IRR. All the assumptions made while estimating the projected profitability of the project activity and the IRR are based on documentary evidence, copies of are submitted to DOE for verification.

Parameter	Value	Remarks
WTG Capacity	1.5 MW and 1.25 MW	Capacity of WTG installed in the project activity
No of WTGs	08 nos.(1.5 MW) and 01 No. (1.25 MW)	
Project cost	Rs. 749.3 million	As per Purchase Orders
Capacity Utilization Factor (CUF)	23%	As per Gujarat Electricity Regulatory Commission order, 2006. CUF based on actual performance of the WTGs is less than 23% <sup>17</sup> .
Power generation	26696 MWh per annum	Computed
Tariff for power sale to grid	Rs. 3.37/ kWh	As per Power Purchase Agreement fixed for 20 years between the GUVNL and PP
Tariff rate for wheeling	Rs. 4.81/ kWh	100% of 1.25 MW WTG and 70% of 1.5MW WTG will be used for captive consumption.
Wheeling	4%	As per GERC Order

<sup>16</sup> The additionality tool referred to carry out the investment analysis suggests that for those projects which can be developed by an entity other than the project proponent, “the benchmark should be based on publicly available data sources which can be validated by DOE. Such data sources may include local lending and borrowing rates, equity indices, or benchmarks determined by relevant national authorities.” In the project activity, PP has used the publicly available information to establish the benchmark using the Government Bond Rates increased by a suitable risk premium, which reflects the return on any investment in the project type, beyond the subjective profitability expectation of the project proponent. The financial structure of the company is thus not relevant and has not been considered as this may change across companies.

<sup>17</sup> The CUF for 2007-08 as per the actual operation has been calculated in Annexure 5 and is below the 23% CUF

## CDM – Executive Board

O&M of WTG	Free for first two years and Rs.1 million per year for 1.25 <sup>18</sup> MW WTG and Rs.1.4 million per WTG per year for 1.50 <sup>19</sup> MW WTG with annual escalation of 5%	As per the contract with wind turbine supplier in the Purchase Order.
O&M charges to GETCO	Rs. 70924 per annum per WTG	Actual charges towards GETCO as per the debit note
O&M charges towards Infrastructure development	Rs. 0.1 million <sup>20</sup> per annum per MW	As per the Purchase Order for Power Evacuation Facility.
Depreciation rate	4.5%	As per the tariff order of GERC.
IT Depreciation	80%	Income Tax Rules
Tax rates	33.66%	As per Income Tax Act of India <a href="http://incometaxindia.gov.in/">http://incometaxindia.gov.in/</a>
Minimum Alternative Tax	11.22%	As per Income Tax Act of India <a href="http://incometaxindia.gov.in/">http://incometaxindia.gov.in/</a>
Service Rate	12.24%	As per the Service Tax rate
Insurance	Rs. 0.9465 million per annum	Actual insurance cost to company for 9 WTGs
Debt	Rs. 5565.5 million	As per loan documents
Interest rate on loan	7.20 % for first 7 years 7.70% for 8 <sup>th</sup> year 8.20% for 9 <sup>th</sup> year	As per the loan documents
Moratorium	15 months	As per the loan documents – repayment is at the end of each quarter
Exchange rate for Euro	Rs. 62	News paper reports

In computing the profitability projections, the tax shield likely to be enjoyed by the parent company on account of accelerated depreciation (though notional) has been taken into account. The tax holiday provided by section 80IA of the Income Tax Act has also been taken into account. Based on the above assumptions, the project IRR works out to 9.97% in contrast to the benchmark of 13.43%. A simple comparison of the two establishes that the project is additional. In fact, the IRR is much less than even

<sup>18</sup> Source for 1.25 MW: RMTL/KUTCH/SEL-S/05-06 Clause 11

<sup>19</sup> Source for 1.5 MW: RMTL/NWM/2006-07/WTG/02 Clause 11.

<sup>20</sup> Source - RMTL/NWM/2006-07/EVAC/01 Clause 5

## CDM – Executive Board

the least risky and more secured Prime Lending Rate (PLR) of Banks, which ranged between 11 and 11.5% during that period.<sup>21</sup>

*Sensitivity Analysis:*

The robustness of the conclusion derived above, i.e., the project is additional has been tested with a sensitivity analysis. Though the Guidance to the assessment of additionality issued by the EB in its 39<sup>th</sup> Meeting is not applicable to this project activity, by virtue of it being a small scale project, nevertheless, the PP has subjected the critical assumptions made in the projections (which account for more than 20% of the cost and revenue) to reasonable variations, i.e., by 5%. The PP has chosen three variables, viz., project cost, CUF and O&M cost. The results of the sensitivity analysis are as follows:

Sensitivity factors considered	Project IRR		
	-5%	Baseline	+5%
Project cost	10.64%	9.97%	9.36%
CUF	9.17%	9.97%	10.76%
O&M Cost	10.12%	9.97%	9.82%
Benchmark	13.4%	13.4%	13.4%

The Sensitivity analysis done with a 10% variation on either side is also presented. The results are given below:

Sensitivity factors considered	Project IRR		
	-10%	Baseline	+10%
Project cost	11.36%	9.97%	8.79%
CUF	8.34%	9.97%	11.52%
O&M cost	10.27%	9.97%	9.67%
Benchmark	13.4%	13.4%	13.4%

It can be seen from the above that the project does not become additional even under the most optimistic assumptions of project cost decreasing by 10% or CUF increasing by 10%.

Though the robustness of the conclusion arrived at has been established with the sensitivity analysis, the PP submits that the optimistic assumptions made for the purpose of sensitivity analysis are not realistic and such conditions are unlikely to occur for the following reasons:

1. Investment: The PP has already released the purchase orders of the wind turbines and in the last few years, the price has been going up and not coming down. Hence, an assumption of even a 5% decrease in project cost is unlikely to happen.
2. Capacity Utilization Factor (CUF): The Capacity Utilization Factor has been recommended by GERC after collection and analysis of exhaustive data on wind in the area. Moreover, the project activity achieved only 18% and 15% CUF for the 1.25 MW and 12 MW capacity WTGs

<sup>21</sup> RBI Bulletin, December 2005 - <http://rbidocs.rbi.org.in/rdocs/Bulletin/PDFs/74643.pdf>

## CDM – Executive Board

respectively during the year gone by. Hence, the possibility of the project activity achieving a CUF of more than 23% is highly remote.

3. O&M Cost: The PP has already signed an O&M Contract with the WTG supplier, which provides for only yearly escalation. Hence, any reduction in O&M Cost is also unrealistic.

In the above background, the PP submits that the project is unlikely to achieve a project IRR of more than 9.97% and hence the project is additional and not a business as usual scenario

### Common Practice Analysis

The total installed capacity for electricity generation in Gujarat in 2004-2005 was 7678.87 MW. Of this, only 219.9<sup>22</sup> MW is from wind installations. The total energy available in the state for the same year was 53410.68<sup>23</sup> GWh of which 350.00<sup>24</sup> GWh was contributed by wind energy. This is merely 0.6% of the total generation as shown in the Table below.

State	% of Total Generation
Tamil Nadu	4.7
Karnataka	1.5
Rajasthan	1.1
Gujarat	0.6
Andhra Pradesh	0.3
Madhya Pradesh	0.1

It can be inferred from the table that the grid penetration of wind power projects in Gujarat is merely 0.6%, which clearly demonstrates that wind power generation is not a common practice in the State.

### Other barriers

WTGs of 1.5 MW capacity are relatively<sup>25</sup> new in India. Not many wind farms have WTGs of such capacity. These are state of the art technology from the manufacturer with newly introduced systems to control and operate and require dedicated management practices. Moreover, power generation in a WTG is considered infirm due to its dependence on availability of suitable wind at all times. The capacity utilization may vary depending on adequate wind availability. CUF in case of WTG may be further affected by the non-availability of grid (grid evacuation problem).

As wind power is infirm, it is not amenable to grid dispatch instructions. Most of the costs of wind energy generation are fixed in nature. For this reason the Gujarat Electricity Regulatory Commission (GERC) decided to have a Single Part tariff for wind power. However, this implies a higher investment risk for the proposed project activity. Thus, transmission unavailability, back-down of generation or part-load operations, which are beyond the control of the investors are likely to affect the project activity

<sup>22</sup> Source: Table No. 2.4, CEA General Review 2006

<sup>23</sup> Source: Table No. 5.3, CEA General Review 2006

<sup>24</sup> Source: Table No. 3.4, CEA General Review 2006

<sup>25</sup> [www.suzlon.com/WindTurbines.html?cp=2\\_3](http://www.suzlon.com/WindTurbines.html?cp=2_3)

## CDM – Executive Board

more severely and therefore the project activity investors would require higher rate of return to compensate them for these risk.

Further the project is located in Zone V<sup>26</sup> with a complicated geology comprising of thrusts and faults. The project area lies in the zone where earthquakes of high intensity occur. There were major earthquakes in the project area in the past, one of them being the 2001 Bhuj earthquake (about 80 Km from the project site), which resulted in considerable damage to property.

### Summary

Thus, it can be summarized that the proposed project activity is not a business-as-usual scenario as it is not a financially viable option available to the project proponent. The primary barriers faced by the proponent are:

- High capital investment as compared to thermal power plants
- Low returns
- Not a common practice
- Other barriers

Further, Capacity Utilization Factor (CUF) depends on several factors such as wind velocity, air density, and quality, which is beyond the control of the project proponent. Another risk involved is related to installation of high capacity wind turbine generators, which are relatively new in India. Thus the project activity is additional and project proponents seek CDM backed benefits to mitigate the risks.

### Early Consideration of CDM

The project participant had considered CDM revenues for the project activity before the installation of windmills. The chronology of events leading to CDM benefits for the project activity is given below. The proof of consideration is provided to the operational entity at the time of validation.

#### Chronology of events<sup>27</sup>

SN	Date	Details
1	9 <sup>th</sup> January 2006	Techno-commercial offer from wind mill supplier Suzlon for 1.25 MW WTG
2	9 <sup>th</sup> January 2006	The project proponent RMTL placed a LOI to Suzlon subject to the Board's consideration of CDM benefits in the meeting scheduled for 28 <sup>th</sup> January 2006.
3	28 <sup>th</sup> January 2006	The Board ratifies the proposal that the company has to avail carbon revenue by registration with UNFCCC and the company confirms the order to Suzlon.
4	15 <sup>th</sup> June 2006	RMTL awards <b>LOI for the CDM work</b> of the project to a Consultant. The Consultant was already entrusted with the responsibility of registration of another 5 MW capacity wind power project by RMTL vide agreement dated 27 <sup>th</sup> December 2005. Hence no offers from other Consultants were invited.

<sup>26</sup> <http://asc-india.org/seismi/seis-gujarat.htm#7> , Refer Annex 6

<sup>27</sup> All evidences for the chronology of events is provided to DOE

## CDM – Executive Board

5	19 <sup>th</sup> June 2006	<b>CDM consultant's acceptance</b> of the LOI as stated in point 4 above.
6	12 <sup>th</sup> December 2006	Techno-commercial offer from Suzlon for 8*1.5 MW WTGs.
7	19 <sup>th</sup> December 2006	RMTL places an order for the supply of 8 WTGs stating specifically therein that the order is subject to the Board's consideration of CDM revenue.
8	29 <sup>th</sup> January 2007	The Board ratifies the proposal that the company has to avail carbon benefits by registering with UNFCCC and the company confirms the order to Suzlon.
9	Email dated 7 <sup>th</sup> March 2007	RMTL cancelled the LOI dated 15 <sup>th</sup> June 2006 with earlier Consultant looking at the slow progress of their already entrusted CDM project activity.
10	16 <sup>th</sup> March 2007	ICICI Bank approves loan for the project activity.
11	E-mails dated 24 <sup>th</sup> April 2007, 23 <sup>rd</sup> June 2007, 26 <sup>th</sup> June 2007, 06 <sup>th</sup> August 2007, 08 <sup>th</sup> August 2007, 15 <sup>th</sup> August 2007	Received from various consultants for awarding the CDM work.
12	30 <sup>th</sup> June 2007	Commissioning date of last WTG..
13	26 <sup>th</sup> September 2007	The project proponent engages another Consultant for registering the project under CDM at UNFCCC.
14	7 <sup>th</sup> November 2007	Email inquiry floated for validation quotation from the DOE by the Consultant
15	26 <sup>th</sup> November 2007	RMTL files for Host Country Approval meeting with the DNA
16	26 <sup>th</sup> December 2007	DNA letter to proponent for presenting the project activity
17	23 <sup>rd</sup> January 2008.	Host Country Approval received
18	6 <sup>th</sup> February 2008	RMTL enters in to contract for validation with DOE.

In view of the above analysis, it is submitted that the CDM was considered as a necessary adjunct for the company to take up this project activity even at the time of planning stage. The sequence of events above also helps conclude that the proponent took concrete steps for registration of the project under CDM in parallel with the implementation of the project.

**B.6. Emission reductions:****B.6.1. Explanation of methodological choices:**Baseline emission:

$$BE = \text{GEN} \times \text{CM} / 1000$$

Where;

BE = Baseline emission in tCO<sub>2</sub>/MWh

GEN = Net electricity supplied by WTGs per annum in the project activity in kWh

CM = Combined margin of WR grid in tCO<sub>2</sub>/MWh

## CDM – Executive Board

Project emissions:

There is no emission due to the project activity and hence,  
Emission reduction,  $ER = BE - PE = BE - 0 = BE$

Leakage:

As the energy generating equipment is not transferred from another activity or the existing equipment is transferred to another activity, hence leakage is not to be considered.

**B.6.2. Data and parameters that are available at validation:**

<b>Data / Parameter:</b>	EFgrid, CM, y
Data unit:	tCO <sub>2</sub> / MWh
Description:	Combined Margin for WR grid
Source of data used:	Central Electricity Authority ,India
Value applied:	0.898
Justification of the choice of data or description of measurement methods and procedures actually applied :	Central Electricity Authority (India) is a government body and data published is in line with the methodological requirement. <a href="http://www.cea.nic.in/planning/c%20and%20e/user_guide_ver3.pdf">http://www.cea.nic.in/planning/c%20and%20e/user_guide_ver3.pdf</a>
Any comment:	

<b>Data / Parameter:</b>	EFgrid, OM,y
Data unit:	tCO <sub>2</sub> / MWh
Description:	Operating Margin for WR grid
Source of data used:	Central Electricity Authority ,India
Value applied:	1.00
Justification of the choice of data or description of measurement methods and procedures actually applied :	Central Electricity Authority (India) is a government body and data published is in line with the methodological requirement. <a href="http://www.cea.nic.in/planning/c%20and%20e/user_guide_ver3.pdf">http://www.cea.nic.in/planning/c%20and%20e/user_guide_ver3.pdf</a>
Any comment:	

<b>Data / Parameter:</b>	EFgrid, BM,y
Data unit:	tCO <sub>2</sub> / MWh

CDM – Executive Board

actually applied :	
Any comment:	

**B.6.3 Ex-ante calculation of emission reductions:**

The emission reductions for the project activity are calculated as the power generated from the WTGs multiplied by the grid emission factor of WR grid. The Grid emission factor has been calculated in Section B.4.

GEN = Net electricity supplied by WTGs per annum in the project activity  
 = Capacity of all WTGs in MW X CUF X No of hrs per year X 1000  
 = 13.25 X (23/100) X 365 X 24 X 1000  
 = 26696100 kWh per annum

CM = 0.898 tCO<sub>2</sub>e/ MWh

ER = 26696100 X 0.898 / 1000  
 = **23960 tCO<sub>2</sub>/ annum**

**B.6.4 Summary of the ex-ante estimation of emission reductions:**

Year	Estimation of project activity emissions (tCO <sub>2</sub> e)	Estimation of baseline emissions (tCO <sub>2</sub> e)	Estimation of leakage (tCO <sub>2</sub> e)	Estimation of overall emission reductions (tCO <sub>2</sub> e)
2008-09*	0	23960	0	23960
2009-10	0	23960	0	23960
2010-11	0	23960	0	23960
2011-12	0	23960	0	23960
2012-13	0	23960	0	23960
2013-14	0	23960	0	23960
2014-15	0	23960	0	23960
2015-16	0	23960	0	23960
2016-17	0	23960	0	23960
2017-18	0	23960	0	23960
<b>Total</b> (tonnes of CO <sub>2</sub> e)	<b>0</b>	239600	0	239600

\*Period: December – November every year

**B.7 Application of a monitoring methodology and description of the monitoring plan:****B.7.1 Data and parameters monitored:**

<b>Data / Parameter:</b>	GEN
<b>Data unit:</b>	kWh per annum

CDM – Executive Board

Description:	Net electricity supplied by WTGs per annum in the project activity
Source of data to be used:	Monthly certificates issued by GEDA/ Electricity meter installed by State Electricity Board at uploading station connected to WTGs
Value of data	26696100 (per annum)
Description of measurement methods and procedures to be applied:	Reading from meter installed by State Electricity Board at uploading station as shown in section B.7.2 is used for estimation of emission reduction in the project activity. Meter readings are taken jointly by respective SEB and O&M service provider
QA/QC procedures to be applied:	These meters are the property of state electricity boards and calibration of the meters will be carried out by them as per UNFCCC requirements. The meters have an accuracy class of 0.5s.
Any comment:	

#### **B.7.2 Description of the monitoring plan:**

The project proponents have proposed a detailed procedure to ensure proper monitoring for the purpose of CDM activity.

The methodology requires monitoring of the electricity generation from the project activity. Analysis of daily power generation reports, performance report and monthly meter reading will be handled by project proponent on a regular basis. The metering system shall comprise a main meter and a back up meter, which will be sealed in the presence of the representatives of the power producer and GETCO. The State Electricity Board personnel will take reading of power generation every month; this data will be used for billing purposes.

The meter reading taken jointly at the appointed date and time will be signed by the representatives of the GUVNL, GETCO and the O&M service provider every month. The back up meter shall be used during the period the main metering system is not in service. The project proponent will ensure that the meters are repaired, re-calibrated or replaced immediately in case they are found to be outside the acceptable limits of accuracy or not functioning properly. The meters will be calibrated at least once in three years as per UNFCCC guidelines<sup>28</sup>. The metering arrangement details are provided in Annex 4 of the document.

The proponent shall keep complete and accurate records and all other data required for the purpose of proper administration and operation of the windmills. The proponent shall also maintain an accurate and up-to-date operating log at the wind mill sites. The data will be kept for at least 2 years after the end of the crediting period or the last issuance of CERs for the project activity, whichever occurs later.

#### **B.8 Date of completion of the application of the baseline and monitoring methodology and the name of the responsible person(s)/entity(ies)**

Date of completion of the application of the baseline and monitoring methodology: 14/08/2008

Mr. Vimal Katta  
**Ratnamani Metals and Tubes Ltd**

<sup>28</sup> [http://cdm.unfccc.int/EB/035/eb35\\_repan35.pdf](http://cdm.unfccc.int/EB/035/eb35_repan35.pdf) , Page 3

### SECTION C. Duration of the project activity / crediting period

#### C.1 Duration of the project activity:

##### C.1.1. Starting date of the project activity:

28/1/2006

##### C.1.2. Expected operational lifetime of the project activity:

20 years

#### C.2 Choice of the crediting period and related information:

##### C.2.1. Renewable crediting period

NA

##### C.2.1.1. Starting date of the first crediting period:

##### C.2.1.2. Length of the first crediting period:

##### C.2.2. Fixed crediting period:

##### C.2.2.1. Starting date:

01/01/2009 or date of registration of project activity, whichever is later

##### C.2.2.2. Length:

10 years

### SECTION D. Environmental impacts

**D.1. If required by the host Party, documentation on the analysis of the environmental impacts of the project activity:**

## CDM – Executive Board

Ministry of Environment and Forest i.e. Government of India does not require any Environment Impact Assessment (EIA) of wind turbine projects<sup>29</sup>. The project activity does not result in any negative impacts on environment. It results in no emission of GHGs and other gases i.e. SO<sub>x</sub> and NO<sub>x</sub> common in conventional power generation sources.

**D.2. If environmental impacts are considered significant by the project participants or the host Party, please provide conclusions and all references to support documentation of an environmental impact assessment undertaken in accordance with the procedures as required by the host Party:**

The project activity is a renewable energy project. Wind power projects do not negatively impact environment and are only having positive environmental benefits.

### SECTION E. Stakeholders' comments

#### E.1. Brief description how comments by local stakeholders have been invited and compiled:

In the project activity following stakeholders were identified –

1. Sarpanch
2. Villagers

Comments, suggestions were invited from one and all on the project activity. A newspaper advertisement detailing about the project activity was published in local daily “*Kutch Mitra*” on 14 November 2007. A general meeting was conducted in Vanku, Suthri, Kamand, Arikhana villages for discussion on project activity and its impact on people in the area. The meeting was attended by Sarpanch (Village head) - Gram panchayat and the local people in the area.

#### E.2. Summary of the comments received:

Against the newspaper advertisement, letters were also sent to the stakeholders to get their opinion of the project. They were informed that project is set up collectively by Suzlon as developer as per MOU signed with Govt. of Gujarat and according to wind power policy declared by states and Gujarat Electricity Regulatory Commission within frame work of Electricity Act 2003.

The general meeting was conducted by project proponent at the project site. Mr. Rakesh Sharma and Mr. Prakash Christine from the company first welcomed all and informed them about the purpose of meeting and wind power generation. People asked a few queries about the project and technology and whether it had any negative impact on people, animals, crop or rains. Mr. Prakash Christine detailed them about wind power technology, wind power development in India and the effects, CDM made on wind power penetration in the country. They were also briefed on CDM process and why the consultations were being held.

---

CDM – Executive Board

Mr. Sharma explained about the wind power generation system and told them that there was no scientific study suggesting any negative impact on environment including effect on rains. People in general appreciated the efforts and wished all luck to the group.

<b>E.3. Report on how due account was taken of any comments received:</b>
---------------------------------------------------------------------------

People participated with great enthusiasm and raised a few questions, which were answered to in an appropriate manner by the project proponent. The gathering applauded the efforts and thanked for calling them for discussion.

**Annex 4****MONITORING INFORMATION****Metering arrangement for Wind Farm**

Metering of wind power is done as under:

- Joint meter reading is taken at Meter-1 by representative of GETCO (Gujarat Energy Transmission Company, GEDA (Gujarat Energy Development Agency) and O&M service provider (on behalf of individual wind farm owners). Meter-1 (M-1) is the meter at the substation. Let us assume total generation recorded for particular month is 'X' units.
- Joint meter reading is taken at Local Meter-3 by representative of GEDA (Gujarat Energy Development Agency) and O&M service provider (on behalf of individual wind farm owners). Let us assume total generation recorded for particular month is 'Y1' units.
- Similarly joint meter reading for other wind farm owners is also taken. Let us assume generation of individual owner recorded for particular month are ..... 'Y2, Y3.....Yn' units.
- GEDA distributes 'X' to individual wind farm owners using following formula and issues monthly certificates.

'Y1'

- For RMTL (project promoter): Units generated = 'X' x  $\frac{\text{'Y1'}}{\text{'Y1+Y2+Y3....+Yn'}}$ 
  - In other words, total 'X' units are shared in proportion to generation by individual wind turbine / wind farms.
- Based on certificates issued by GEDA, either credit in consumption is given by corresponding distribution company after deducting 4% wheeling charges or power is purchased by Gujarat Urja Vikas Nigam Ltd. (GUVNL) @ Rs.3.37 without deducting wheeling charges.

CERTIFIED TRUE COPY OF THE RESOLUTION PASSED BY THE BOARD OF DIRECTORS OF RATNAMANI METALS & TUBES LTD. IN THEIR MEETING HELD ON 28<sup>TH</sup> JANUARY 2006 AT THE REGISTERED OFFICE OF THE COMPANY SITUATED AT 17, RAJMUGAT SOCIETY, NARANPURA CHAR RASTA, ANKUR ROAD, NARANPURA, AHMEDABAD – 380 013.

**TO CONSIDER AND DISCUSS RISKS AND CDM BENEFITS FROM THE WIND TURBINES**

The Board discussed the risks inherent to the proposed Wind Energy installations at V-12, Survey No. 275/1, Village Vanku, Taluka : Abdasa, Dist. Kutch, State Gujarat and also the possible CDM benefits that can be availed.

"RESOLVED THAT cash flows during the pay back period of the Windmill Project would greatly depend on the generation and grid availability. The Company is undertaking a risk by making a big investment in a technology that may have inconsistent returns. Thus the project carries an inherent risk of power generation."

The Directors are aware that the Government of India has ratified an International Legislation, Kyoto Protocol, working towards mitigation of green house gas concentrations across the globe. The protocol enables a market mechanism, Clean Development Mechanism (CDM), and may provide a source of additional revenue stream to mitigate the risks associated with projects similar to our kind.

"RESOLVED THAT the reduction in emissions of carbon dioxide and other GHGs will be additional to the business as usual scenario in the Indian Power Sector and result in real, measurable and long-term benefits in climate change mitigation. Therefore the project shall be made eligible for carbon revenue by registration under the CDM of the UNFCCC and the CER revenue gained by sale of credits to industrialized countries shall strengthen the finances of the Project and minimize associated risks."

CERTIFIED TRUE EXTRACT OF THE RESOLUTION PASSED BY THE BOARD OF DIRECTORS OF RATNAMANI METALS & TUBES LTD. IN THEIR MEETING HELD ON 29<sup>TH</sup> JANUARY 2007 AT THE REGISTERED OFFICE OF THE COMPANY SITUATED AT 17, RAJMUGAT SOCIETY, NARANPURA CHAR RASTA, ANKUR ROAD, NARANPURA, AHMEDABAD – 380 013.

**SETTING UP OF 8 WINDMILLS IN MOTI SINDHOLI SITE OF M/S. SUZLON (WINDMILL PROJECT)**

- (A) The Managing Director informed the Board that in view of the better profitability due to increased turnover, it would be beneficial to the Company to invest funds in setting up Windmills at the above site of M/s. Suzlon. This will help in reducing the effective tax outflow. Accordingly it is proposed to invest in setting up 8 windmills of 1500 KW each at an aggregate cost of Rs.6889.68 lacs in Moti Sindholi site of M/s. Suzlon. The Managing Director thereafter discussed in detail mentioning following salient features.
- The Promoters contribution shall be equivalent to the tax saving because of depreciation on windmills (approximately 15% of the project cost)
  - The balance amount (approximately Rs.5856 lacs) shall be funded through borrowings.
  - The units generated would be sold to GEB @ Rs.3.37 per unit as per the Revised Windmill Energy Policy of Government of Gujarat or the Company may opt for any more beneficial scheme as may be announced by the State / Central Government in future at the time of commissioning of Windmills or thereafter, as may be applicable to Windmill Projects.
  - The Windmill Investment will be eligible for benefits under CDM by way of CERs in respect of units generated which can be sold at attractive price thus making the investment more attractive.
  - The total re-payment period shall be 9 years with 1 year moratorium

The Managing Director thereafter informed the Board that we have already approached Bank of Maharashtra, State Bank of India, ICICI Bank Ltd., UTI Bank Ltd., to consider our request for sanction of Term Loan. He added that the proposal is in advance stage of consideration with all these lenders and that we would take loan from such lender who would offer best terms and conditions matching our expectations.

The Managing Director also advised the Board that the security offered is Exclusive Charge on windmills, Personal Guarantee of one of the Directors and if necessary extension of the 2<sup>nd</sup> charge on the entire fixed assets of the Company. The matter was discussed at great length and the following resolutions were passed unanimously.

"RESOLVED THAT in view of the policy of the State Government of Gujarat for the promotion of Wind Power Projects, the Company do invest an amount of Rs.6,889.68 lacs by setting up 8 windmills of 1500 KW each in Moti Sindholi site of M/s. Suzlon and that the action of the Managing Director in releasing orders to M/s. Suzlon Engineering Ltd. on 15<sup>th</sup> December 2006 and 12<sup>th</sup> January 2007 at total cost of Rs.6,889.68 lacs be and is hereby approved and ratified."
