Revision history of this document

Version Number	Date	Description and reason of revision
01	21 January 2003	Initial adoption
02	8 July 2005	<ul style="list-style-type: none">■ The Board agreed to revise the CDM SSC PDD to reflect guidance and clarifications provided by the Board since version 01 of this document.■ As a consequence, the guidelines for completing CDM SSC PDD have been revised accordingly to version 2. The latest version can be found at http://cdm.unfccc.int/Reference/Documents.
03	22 December 2006	<ul style="list-style-type: none">■ The Board agreed to revise the CDM project design document for small-scale activities (CDM-SSC-PDD), taking into account CDM-PDD and CDM-NM.

CDM – Executive Board

SECTION A. General description of small-scale project activity**A.1 Title of the small-scale project activity:**

>>

- Project Title: 3MW Shinan Wind power project
- Version: 02.46
- Date: ~~2120 Mar Oct.~~ 201309

A.2. Description of the small-scale project activity:

>>

Project Description

Shinan Wind power plant is located at San 1-1, Gurim-ri, Bigeum-myeon, Shinan-gun, Jeollanam-do, Republic of Korea. Installed Wind power turbine-generator unit has capacity 1,000kW × 3units. The project will generate 6,400MWh/yr with 24.4% efficiency and supply the electricity to the grid.

The project site has advantageous terms for Wind Farm. It is spacious and has no obstruction like a building or any other structures. Average wind velocity is 6.1m/s at a height of 70m.

The project participant is Shinan wind power Co., Ltd. It is a subsidiary of Dongkuk S&C Co., Ltd.

Dongkuk S&C Co., Ltd. has an about 10% world market share of wind tower. Also it has been exporting wind tower to major wind power companies like a VESTAS, Enercon, Gamesa, GE, Siemens, Mitsubishi heavy industries and etc.

The purpose of the project is contributes to the international effort to prevent global warming by using renewable energy. The wind power plant generates electricity utilizing wind energy which emits zero greenhouse gas (GHG) into the atmosphere or water system without any natural resources depletion. The project supports the government policy which promotes development of renewable energy technology in Republic of Korea. The project also contributes to decrease dependence on electricity generated by thermal power plants using fossil fuel which takes 63.1% of electricity generation in Korea (Source: Statistics of Electric Power in 2007, KEPCO 2008).

Contribution to sustainable development

By using renewable local source of energy, the project will contribute to sustainable development in Republic Korea as follows:

- Power generation from wind power plants reduces consumption of fossil fuels, decreases imports of fossil fuel, and hence brings in national profits.
- As an alternative energy source, wind power does not emit air pollutants or wastes.
- As the renewable energy source, wind power does not deplete natural resources and therefore it will be used as alternative energy sustainable by future generations.
- There are no Green House Gas (GHG) emissions.
- Demonstrate replicable clean energy technology.

A.3. Project participants:

>>

CDM – Executive Board

Name of Party involved (*) ((host) indicates a host Party)	Private and/or public entity(ies) project participants (*) (as applicable)	Kindly indicate if the Party involved wishes to be considered as project participant (Yes/No)
Republic of Korea (host)	• Private entity: Shinan wind power Co., Ltd.	No

A.4. Technical description of the small-scale project activity:**A.4.1. Location of the small-scale project activity:**

>>

A.4.1.1. Host Party(ies):

>>

Republic of Korea

A.4.1.2. Region/State/Province etc.:

>>

Jeollanam-do

A.4.1.3. City/Town/Community etc.:

>>

San 1-1, Gurim-ri, Bigeum-myeon, Shinan-gun

A.4.1.4. Details of physical location, including information allowing the unique identification of this small-scale project activity :

>>

The project site is located at the East 125°56'03", North 34° 46'29" that is seashore of the Bigeum Island.

[Figure 1] the location of the project

A.4.2. Type and category(ies) and technology/measure of the small-scale project activity:

>>

Type and Category of the project

Type: I – Renewable energy projects

Category: I.D – Grid connected renewable electricity generation

The project type, as defined in UNFCCC's Appendix B of "the simplified modalities and procedures for small-scale CDM project activities", is I.D: Renewable energy projects; Grid connected renewable electricity generation.

The project generates electricity utilizing renewable energy, wind, and supplies the electricity to the grid. Furthermore, the total installed wind power turbine-generator unit capacity of the power plant is 3MW which is less than 15MW. Therefore, the methodology AMS I.D. is eligible for the project activity.

Applied Technology of the project

Rotor transforms kinetic energy of wind into rotational energy. And then induction generator produces power using rotational energy.

- Rotor system: transforms wind energy into rotational energy
- Power delivery system: delivers rotational energy to electricity transformation system.

CDM – Executive Board

- Electricity interconnection system: transforms rotational energy into electricity energy and makes produced power be satisfied in the quality of electricity interconnection
- Assistants system: control device, rotor, steel tower, structure and etc.

<Table 1> wind power electric equipment specification

Classification		Details
Manufacturer		Mitsubishi
Blade	Material	Glass fiber reinforced plastics
	Rotor diameter	61.4m
	Swept area	2,960m ²
	The number of blade	3
TurbineGenerator (MWT-1000A)	Type	Induction generator
	Wind velocity	12.5m/s
	Output Voltage	600V
	Output power	1,000kW
	Rotational Speed	19.8rpm
	Cooling system	Air cooling
Generator (HRQ1 455-48E)	Output Power	1,100kW
	Output Voltage	600V
Steel Tower	Type	Tubular
	Height	66.9m

CDM – Executive Board

[Figure 4] Analysis of wind sources

A.4.3 Estimated amount of emission reductions over the chosen crediting period:

>>

Years	Estimation of annual emission reductions in tonnes of CO ₂ e
Dec 2009~Nov 2010	3,901
Dec 2010~Nov 2011	3,901
Dec 2011~Nov 2012	3,901
Dec 2012~Nov 2013	3,901
Dec 2013~Nov 2014	3,901
Dec 2014~Nov 2015	3,901
Dec 2015~Nov 2016	3,901
Total estimated reductions (tonnes of CO ₂ e)	27,310
Total number of crediting years	7
Annual average of the estimated reductions over the crediting period (tCO₂ e)	3,901

A.4.4. Public funding of the small-scale project activity:

>>

No public funding is provided for the project.

CDM – Executive Board

A.4.5. Confirmation that the small-scale project activity is not a debundled component of a large scale project activity:

>>

The project is not a part of any large scale project activity.

According to Appendix C of the simplified modalities and procedures for small-scale CDM project activities, debundling is defined as the fragmentation of a large project activity into smaller parts.

The proposed wind power project activity shall be deemed to be a debundled component of a large project activity if there is a registered small-scale CDM project activity or another small-scale CDM project activity requested for registration which has the conditions as follows:

- With the same project participants;
- In the same project category and technology/measure; and
- Registered within the previous 2 years; and
- Whose project boundary is within 1 km of the project boundary of the proposed small-scale activity at the closest point.

The project does not belong in above 4 things. Therefore, this is not a debundled part of large-scale project activities.

SECTION B. Application of a baseline and monitoring methodology
B.1. Title and reference of the approved baseline and monitoring methodology applied to the small-scale project activity:

>>

Methodology Title: AMS-I. D: Grid connected renewable electricity generation (Version 13, 14 Dec 2007)

Reference: Appendix B of the simplified modalities and procedures for small-scale CDM project activities

B.2 Justification of the choice of the project category:

>>

The renewable energy projects include wind power generation and the maximum output capacity is required not to be over 15MW to be eligible for type I project activities. The project is to construct 3MW installed wind power turbine-generator unit capacity project activities. Therefore, the project comes under type I project activities. If a kind of renewable energy project of type I is to supply electricity into a grid, the project belongs to I.D categories, specially. In case of Shinan Wind power project, it is among category I.D., because all of generated electricity is provided into grid system of Republic of Korea through connection line to the transformer substation located at Gurim-ri, Bigeum-myeon, Shinan-gun, Jeollanam-do.

B.3. Description of the project boundary:

>>

For the baseline determination, project boundary is related to CO₂ emissions from electricity generation in a fossil fuel fired power that is displaced due to the project activity. The spatial extent of the project boundary includes the project site and all the power plants connected physically to the grid of Korea Electric Power Corporation (KEPCO).

For calculation of baseline GHG emission from the project boundary does not include emission during plant construction, leakage from electricity transfer, and emission from transportation, mining, and pumping

B.4. Description of baseline and its development:
--

>>

According to clause 9 of AMS I.D version 13, the baseline is the kWh produced by the renewable generating unit multiplied by an emission coefficient (measured in kg CO₂e/kWh) calculated in a transparent and conservative manner as:

(a) A combined margin(CM), consisting of the combination of operating margin(OM) and build margin(BM) according to the procedures prescribed in the “Tool to calculate the emission factor for an electricity system”.

OR

(b) The weighted average emissions (in kg CO₂equ/kWh) of the current generation mix. The data of the year in which project generation occurs must be used.

Therefore the baseline for the project was calculated according to “Tool to calculate the emission factor for an electricity system(version 01.1)”, on the authority of (a) as mentioned above. The baseline emission factor (EF_y) was calculated as a combined margin (CM), consisting of the combination of operating margin(OM) and build margin(BM) factors according to the following six steps. In calculating this combined margin(CM), the data originated from existing power plants were applied. Here, these data were collected from the Statistics of Electric Power published at the most recent 3-years (KEPCO 2006-2008), and should be proper because the host country of the project, Republic of Korea, does not import/export electricity from/to other countries.

STEP 1. Identify the relevant electric power system

For the purpose of determining the electricity emission factors, a **project electricity system** is defined by the spatial extent of the power plants that are physically connected through transmission and distribution lines to the project activity (e.g. the renewable power plant location or the consumers where electricity is being saved) and that can be dispatched without significant transmission constraints.

Similarly, a **connected electricity system**, e.g. national or international, is defined as an electricity system that is connected by transmission lines to the project electricity system. Power plants within the connected electricity system can be dispatched without significant transmission constraints but transmission to the project electricity system has significant transmission constraint.

If the DNA of the host country has published a delineation of the project electricity system and connected electricity systems, these delineations should be used. If such delineations are not available, project participants should define the project electricity system and any connected electricity system and justify and document their assumptions in the CDM-PDD. In doing, so the following criteria can be used to determine the existence of significant transmission constraints:

- In case of electricity systems with spot markets for electricity: there are differences in electricity prices (without transmission and distribution costs) of more than 5 percent between the systems during 60 percent or more of the hours of the year.
- The transmission line is operated at 90% or more of its rated capacity during 90% percent or more of the hours of the year.

In this sense, it is clear that the project electric power system is connected with the whole Korean national grid system. Because all of power plants, including proposed wind power project, are physically connected to each other through transmission and distribution lines constituting the grid. Therefore the

CDM – Executive Board

Korean national grid has been chosen as relevant electricity power system for purpose of determining the electricity emission factors.

[Figure 5] Electric Power Grid Nationwide in Republic of Korea
Source: 2008 Annual Report (KEPCO)

STEP 2. Select an operating margin (OM) method

The calculation of the Operating Margin emission factor ($EF_{grid,OM,y}$) shall be calculated based on one of the four following methods:

- Option (a) Simple OM
Option (b) Simple adjusted OM
Option (c) Dispatch Data Analysis OM
Option (d) Average OM

If low-cost/must-run resources constitute less than 50% of total grid generation in average of the five

CDM – Executive Board

most recent years, simple OM can be chosen.

Referring to the gross electricity generation rate by energy sources of the host country, Republic of Korea, the rate of low cost/must run power generation does not exceed 50% of the total grid. Actually, the most recent 5-year (2003~2007) average data shows that the rate of low cost/must run is 41.49%. (Source: Statistics of Electric Power in 2007, KEPCO 2008)

Therefore, for the project case, “Option (a) Simple OM” is available. <Table 2> shows the yearly proportion of the generation of electricity based on the source of energy (Source: Statistics of Electric Power in 2007, KEPCO 2008)

<Table 2> Gross generation by energy sources

(Unit: million kWh)

Year		2003	2004	2005	2006	2007
Item						
Hydro*		6,887	5,861	5,189	5,219	5,042
Thermal	Domestic Coal*	5,398	4,603	4,484	4,312	4,470

		41.49				

Source: Statistics of Electric Power in 2007, KEPCO 2008

(* low-operating cost and must-run power plants)

And the Simple OM emission factor can be calculated using either of the two following data vintages for years(s) y:

- Ex ante option: A 3-year generation-weighted average, based on the most recent data available at the time of submission of the CDM-PDD to the DOE for validation, without requirement to monitor and recalculate the emissions factor during the crediting period, or
- Ex post option: The year in which the project activity displaces grid electricity, requiring the emissions factor to be updated annually during monitoring. If the data required calculating the emission factor for year y is usually only available later than six months after the end of year y, alternatively the emission factor of the previous year (y-1) may be used. If the data is usually only available 18 months after the end of year y, the emission factor of the year proceeding the previous year (y-2) may be used. The same data vintage (y, y-1 or y-2) should be used throughout all crediting periods.

On this PDD, *ex-ante* data were applied. The Simple OM emission factor is calculated as following step 3.

STEP 3. Calculate the Operating Margin emission factor ($EF_{grid,OM,y}$)

CDM – Executive Board

The simple OM emission factor is calculated as the generation-weighted emissions per electricity unit of all generating units serving the system, excluding low-operating cost and must-run power plants. Low-operating cost and must run power plants include hydro, nuclear, low cost biomass, geothermal and domestic coal. And it is calculated based on data on fuel consumption and net electricity generation of each power plant /unit (Option A) as follows:

$$EF_{grid,OMSimple,y} = \frac{\sum_{i,m} FC_{i,m,y} \cdot NCV_{i,y} \cdot EF_{CO_2,i,j}}{\sum_m EG_{m,y}} \quad (1)$$

Where:

- $EF_{grid,OMSimple,y}$ = Simple operating margin CO₂ emission factor in year y (tCO₂/MWh)
- $FC_{i,m,y}$ = Amount of fossil fuel type i consumed by power plant / unit m in year y (mass or volume unit)
- $NCV_{i,y}$ = Net calorific value (energy content) of fossil fuel type i in year y (GJ / mass or volume unit)
- $EF_{CO_2,i,y}$ = CO₂ emission factor of fossil fuel type i in year y (tCO₂/GJ)
- $EG_{m,y}$ = Net electricity generated and delivered to the grid by power plant / unit m in year y (MWh)
- m = All power plants / units serving the grid in year y except low-cost / must-run power plants / units
- i = All fossil fuel types combusted in power plant / unit m in year y
- y = Either the three most recent years for which data is available at the time of submission of the CDM-PDD to the DOE for validation (ex ante option) or the applicable year during monitoring (ex post option), following the guidance on data vintage in step 2

The applied parameters are presented for estimation of Operating Margin emission factor ($EF_{grid,OM,y}$) at <Table Annex-1, 2, 3> in Annex 3.

STEP 4. Identify the cohort of power units to be included in the Build Margin emission factor ($EF_{grid,BM,y}$)

The sample group of power unit m used to calculate the build margin consists of either:

- The set of five power units that have been built most recently, or
- The set of power capacity additions in the electricity system that comprise 20% of the system generation (in MWh) and that have been built most recently.

Project participants should use the set of power units that comprises the larger annual generation.

As a general guidance, a power unit is considered to have been built at the date when it started to supply electricity to the grid.

Power plant registered as CDM project activities should be excluded from the sample group m. However, If group of power units, not registered as CDM project activity, identified for estimating the build margin emission factor includes power unit(s) that is(are) built more than 10 years ago then:

CDM – Executive Board

- (i) exclude power unit(s) that is (are) built more than 10 years ago from the group; and
- (ii) include grid connected power projects registered as CDM project activities, which are dispatched by dispatching authority to the electricity system.

Capacity additions from retrofits of power plants should not be included in the calculation of the build margin emission factor.

In terms of vintage of data, project participants can choose between one of the following two options:

Option 1. For the first crediting period, calculate the build margin emission factor ex-ante based on the most recent information available on units already built for sample group m at the time of CDM-PDD submission to the DOE for validation. For the second crediting period, the build margin emission factor should be updated based on the most recent information available on units already built at the time of submission of the request for renewal of the crediting period to the DOE. For the third crediting period, the build margin emission factor calculated for the second crediting period should be used. This option does not require monitoring the emission factor during the crediting period.

Option 2. For the first crediting period, the build margin emission factor shall be updated annually, ex-post, including those units built up to the year of registration of the project activity or, if information up to the year of registration is not yet available, including those units built up to the latest year for which information is available. For the second crediting period, the build margin emissions factor shall be calculated ex-ante, as described in option 1 above. For the third crediting period, the build margin emission factor calculated for the second crediting period should be used.

For the project case, *Option 1* is taken to calculate the Build Margin emission factor, $EF_{grid,BM,y}$ ex-ante, and it is estimated as <Table 3> according to each regulation to compose proper sample group(m) that the electricity quantity of candidate sample groups and in ratio to total generation in Korea.

<Table 3> Sample Plant group(m) for determining Build margin Emission factor

Sample group(m) Classification	Regulation 1	Regulation 2	Comments
	“The five power plants that have been built most recently”	“The power plants capacity additions in the electricity system that comprise 20% of the system generation (in MWh) and that have been built most recently.”	
Electricity quantity	33 MWh	84,736,759 MWh	Total generation is 385,990,619MWh in Korea (Source: Statistics of Electric Power in 2007, KEPCO 2008) CDM registered Power plants generation is 376,177MWh.
Proportion (ratio to total generation in Korea)	0.00001%	21.953%	
Selected Group		O	

The annual generation of “the five power plants that have been built most recently” was 33MWh (0.00001% of total generation of the grid system), and the annual generation of “the power plants capacity additions in the electricity system that comprise 21.953% of the system generation and that have

CDM – Executive Board

been built most recently” was 84,736,759MWh. Therefore, the latter was chosen for the project as a larger figure than the other one. It is presented at <Table Annex-4> in Annex 3 that the sample group of plants used in the Build Margin emission factor ($EF_{grid,BM,y}$).

STEP 5. Calculate the build margin emission factor ($EF_{grid,BM,y}$)

The build margin emissions factor is the generation-weighted average emission factor (tCO₂/MWh) of all power units m during the most recent year y for which power generation data is available, calculated as follows:

$$EF_{grid,BM,y} = \frac{\sum_m EG_{m,y} \cdot EF_{EL,m,y}}{\sum_m EG_{m,y}} \quad (2)$$

Where:

- $EF_{grid,BM,y}$ = Build margin CO₂ emission factor in year y (tCO₂/MWh)
- $EG_{m,y}$ = Net quantity of electricity generated and delivered to the grid by power unit m in year y (MWh)
- $EF_{EL,m,y}$ = CO₂ emission factor of power unit m in year y (tCO₂/MWh)
- m = Power units included in the build margin
- y = Most recent historical year for which power generation data is available

STEP 6. Calculate the combined margin emissions factor ($EF_{grid,CM,y}$)

The combined margin emissions factor is calculated using the following formula:

$$EF_{grid,CM,y} = w_{OM} \cdot EF_{grid,OM,y} + w_{BM} \cdot EF_{grid,BM,y} \quad (3)$$

Where:

- $EF_{grid,BM,y}$ = Build margin CO₂ emission factor in year y (tCO₂/MWh)
- $EF_{grid,OM,y}$ = Operating margin CO₂ emission factor in year y (tCO₂/MWh)
- w_{OM} = Weighting of operating margin emissions factor (%)
- w_{BM} = Weighting of build margin emissions factor (%)

•Wind and solar power generation project activities: $w_{OM} = 0.75$ and $w_{BM} = 0.25$ (owing to their intermittent and non-dispatchable nature) for the first crediting period and for subsequent crediting periods.

•All other projects: $w_{OM} = 0.5$ and $w_{BM} = 0.5$ for the first crediting period, and $w_{OM} = 0.25$ and $w_{BM} = 0.75$ for the second and third crediting period, unless otherwise specified in the approved methodology which refers to this tool.

Alternative weights can be proposed, as long as $w_{OM} + w_{BM} = 1$, for consideration by the Executive Board, taking into account the guidance as described below. The values for $w_{OM} + w_{BM}$ applied by project participants should be fixed for a crediting period and may be revised at the renewal of the crediting period.

CDM – Executive Board

Depending on AMS I.D (Version13), baseline emissions should be obtained by the below equation

$$BE_y = (EG_y - EG_{baseline}) \cdot EF_y \quad (4)$$

where:

BE_y is the baseline emissions (in tCO₂)

EG_y is the electricity supplied by the project activity to the grid (in MWh)

$EG_{baseline}$ is the baseline electricity supplied to the grid in the case of modified or retrofit facilities (in MWh)

EF_y is the baseline emissions factor (in tCO₂/MWh)

However $EG_{baseline}$ is zero because there are no modified or retrofit facilities in the project. Therefore the baseline emissions (BE_y) can be calculated as follows;

$$BE_y = EG_y \cdot EF_y \quad (5)$$

The key information and data used for calculation of baseline emission by the project activity have been taken from following sources.

<Table 4> Key information and data used to determine the baseline scenario

Parameter	Value	Source
$EG_{m,y}$ (MWh) is the electricity delivered to the grid by source m .	Refer to <Table Annex-3>	Statistics of Electric Power in 2005-2007, KEPCO 2006-2008
$FC_{i,m,y}$ is the amount of fuel i (in a mass or volume unit) consumed by relevant power sources m in year(s) y , m refers to the power sources delivering electricity to the grid, not including low-operating cost and must-run power plants, and including imports to the grid	Refer to <Table Annex-1>	Statistics of Electric Power in 2005-2007, KEPCO 2006-2008
Net Calorific Values by Power Plant	Refer to <Table Annex-2>	Caloric value sourced from Statistics of Electric Power in 2005-2007, KEPCO 2006-2008 (net caloric value = Caloric value* net caloric value conversion factor)
Net Caloric Values Conversion Factor	Solid/Liquid fuel : 0.95 Gaseous fuel : 0.90	2006 IPCC Guidelines for National Greenhouse Gas Inventories
Fuels CO₂ Emission Factor ($EF_{CO_2,i}$)	Refer to <Table Annex-5>	2006 IPCC Guidelines for National Greenhouse Gas Inventories 1.21
$EF_{grid,OMy}$ Operating Margin Emissions Factor (in ton CO ₂ /MWh) 2005~2007	0.6817	Calculated

CDM – Executive Board

Parameter	Value	Source
$EF_{grid,BM,y}$ Build Margin Emissions Factor (in ton CO ₂ /MWh)	0.3933	Calculated
$EF_{grid,CM,y}$ Baseline Emissions Factor (in ton CO ₂ /MWh)	0.6096	Calculated

B.5. Description of how the anthropogenic emissions of GHG by sources are reduced below those that would have occurred in the absence of the registered small-scale CDM project activity:

>>

The additionality on investment barrier

To prove additionality of the project, attachment A to Appendix B of the simplified modalities and procedures for small-scale CDM project activities was referred. According to attachment A to Appendix B of the simplified modalities and procedures for small-scale CDM project activities, project participants shall provide an explanation to show that the project activity would not have occurred anyway due to at least one of barriers such as investment barrier, technological barrier, barrier due to prevailing practice or other barriers.

The biggest barrier of the project is investment barrier because proposed wind power project requires high investment cost, but expectation of capital return is low. Due to these reasons, these wind power plants are not attractive alternative as power generation. It can be explained by calculating IRR (Internal Rate of Return). IRR is the discount rate which makes that present value of income flow and present value of cost flow same.

Benchmark rate of the project is **7.7%** based on the interest rate of the loan for the project.

Detail financial parameter and project IRRs of the Shinan wind power plant has been described in the below tables.

CDM – Executive Board

<Table 5> Investment analysis data

Content	Value	Remark
Total Investment Cost (Million won)	6,457	Shinan wind farm construction Investment cost list - an internal document
Electricity supplied by the project activity to grid (MWh/year)	6,400	Feasibility Study Report of Shinan wind power
Unit price of electricity sales (won/KWh)	106.45	Electric Power Statistics Information System (www.kpx.or.kr/epsis): average in Jan~Jul 2008
Operation & Maintenance Cost (Million won/yr)	142	2.2% < The report published by the Ministry of Knowledge Economy, 2006. 3>
Corporation tax (Million won/yr)	42	Corporate Tax Act. - if the taxable standard price is less than hundred million: 13%, in case of the taxable standard price is exceeding hundred million: 13million won + surplus × 25%
Estimated life time (year)	20	

According to the result of investment analysis, IRR of the project is **4.52%** which is lower than benchmark rate (7.7%). Therefore the project cannot be considered financially attractive.

Also sensitivity analysis of three major uncertain elements has range of -10% to +10%. Three major uncertain elements are total investment cost, electricity supplied to grid and O&M cost. According to the result of sensitivity analysis, the project IRR is still lower than benchmark rate.

Considering the project IRR with CERs benefit is **6.27%**. It is 1.5% higher than the base case of IRR, 4.52%. Therefore CERs benefit is one of the key factors to promote the project activity.

In Republic of Korea, government gives subsidy to the new and renewable sources of energy project developers as “Act on the Promotion of the Development and Use of New and Renewable Sources of Energy” from after 26.Sep. 2002. That law encourages investments in renewable energy projects by providing for high price within the feed-in tariff policy.

According to decision of 22nd CDM EB meeting (Annex 3 – Clarifications on the consideration of national and/or sectoral policies and circumstances in baseline scenarios, ver.02), this law was established in 2002 to promote renewable energy policy need not be taken into account in developing a baseline scenario. Thus the law will not be considered in this baseline calculation. Therefore the project does not included subsidy in electricity price in the investment analysis.

In calculating with CERs benefit, CERs price is point carbon secondary CERs average price in Jan~Jul 2008 (source: www.pointcarbon.com) and exchange rate is average value in Jan~Jul 2008 (source: Economic Statistics System of The bank of Korea)

CDM – Executive Board

<Table 6> Sensitivity analysis

Contents	-10%	-5%	0%	+5%	+10%
	Fluctuation of IRR				
Total investment cost	5.83	5.15	4.52	3.93	3.38
Electricity supplied to grid	3.30	3.92	4.52	5.10	5.68
O&M cost	4.76	4.64	4.52	4.3	4.27

[Figure 6] Impacts of three major uncertain elements on IRR

B.6. Emission reductions:

B.6.1. Explanation of methodological choices:

>>

Calculation of Baseline Emission

Depending on “Tool to calculate the emission factor for an electricity system(Version 01.1)”, baseline emissions should be obtained by the below equation (4)

$$BE_y = (EG_y - EG_{baseline}) \cdot EF_y \quad (4)$$

Where,

BE_y : Baseline emissions (in tCO₂)

EG_y : Electricity supplied by the project activity to the grid (in MWh)

$EG_{baseline}$: Baseline electricity supplied to the grid in the case of modified or retrofit facilities (in MWh)

EF_y : Baseline emissions factor (in tCO₂/MWh)

y : Refers to a given year

CDM – Executive Board

However $EG_{baseline}$ is zero because there are no modified or retrofit facilities in the project. Therefore the baseline emissions (BE_y) can be calculated as follows;

$$BE_y = EG_y \cdot EF_y \quad (5)$$

The baseline emission factor (EF_y) calculations will be based on the “Tool to calculate the emission factor for an electricity system(Version01.1)”.

$$EF_{grid,CM,y} = w_{OM} \cdot EF_{grid,OM,y} + w_{BM} \cdot EF_{grid,BM,y} \quad (3)$$

Where,

- $EF_{grid,CM,y}$: Baseline emission factor (tCO₂/MWh)
- w_{OM} : Operation Margin weight, which is 0.75 by default
- w_{BM} : Build Margin weight, which is 0.25 by default
- $EF_{grid,OM,y}$: Operational Margin emission factor (tCO₂/MWh)
- $EF_{grid,BM,y}$: Build Margin emission factor (tCO₂/MWh)
- Y : Refers to a given year

Operational Margin emission factor ($EF_{grid,OM,y}$) is obtained based on ‘Simple OM method’. Build Margin emission factor ($EF_{grid,BM,y}$) is estimated as *Option 1* ($EF_{BM,y}$ *ex-ante*).

The OM emission factors is calculated as follows,

$$EF_{grid,OMSimple,y} = \frac{\sum_{i,m} FC_{i,m,y} \cdot NCV_{i,y} \cdot EF_{CO2,i,y}}{\sum_m EG_{m,y}} \quad (1)$$

Where:

- $EF_{grid,OMSimple,y}$ = Simple operating margin CO₂ emission factor in year y (tCO₂/MWh)
- $FC_{i,m,y}$ = Amount of fossil fuel type i consumed by power plant/unit m in year y (mass or volume unit)
- $NCV_{i,y}$ = Net calorific value (energy content) of fossil fuel type i in year y (GJ/mass or volume unit)
- $EF_{CO2,i,y}$ = CO₂ emission factor of fossil fuel type i in year y (tCO₂/GJ)
- $EG_{m,y}$ = Net electricity generated and delivered to the grid by power plant/unit m in year y (MWh)
- m = All power plants/units serving the grid in year y except low-cost/must-run power plants/units
- i = All fossil fuel types combusted in power plant/unit m in year y
- y = Either the three most recent years for which data is available at the time of submission of the CDM-PDD to the DOE for validation (ex ante option) or the applicable year during monitoring (ex post option), following the guidance on data vintage in step 2

The emission factor of Build margin is calculated using the following equation:

$$EF_{grid,BM,y} = \frac{\sum_m EG_{m,y} \cdot EF_{EL,m,y}}{\sum_m EG_{m,y}} \quad (2)$$

Where:

CDM – Executive Board

- $EF_{grid,BM,y}$ = Build margin CO₂ emission factor in year y (tCO₂/MWh)
 $EG_{m,y}$ = Net quantity of electricity generated and delivered to the grid by power unit m in year y (MWh)
 $EF_{EL,m,y}$ = CO₂ emission factor of power unit m in year y (tCO₂/MWh)
 m = Power units included in the build margin
 y = Most recent historical year for which power generation data is available

Project Emissions

The project is a wind power project: it does not give rise to direct GHG emissions. Therefore, no formulae for calculation of direct emissions are provided here.

Leakage

GHGs emissions due to leakage are not estimated at this point of time from wind power generation.

Emission reduction

Project emission reduction can be estimated by following equation (6)

$$ER_y = BE_y - PE_y - L_y \quad (6)$$

Where

ER_y : The emission reductions by the project activity during a given year y

BE_y : Baseline emissions

PE_y : Project emissions

L_y : Emissions due to leakage

B.6.2. Data and parameters that are available at validation:

Data / Parameter:	EF _y
Data unit:	tCO ₂ /MWh
Description:	CO ₂ emissions intensity of the electricity displaced
Source of data used:	Calculated
Value applied:	0.6096 tCO ₂ /MWh
Justification of the choice of data or description of measurement methods and procedures actually applied :	This value was calculated according to “Tool to calculate the emission factor for an electricity system (version 01.1).” Applied value was calculated by referring Statistics of Electric Power in 2005-2007, KEPCO 2006-2008 and Status of Generation facility (2008) (Korea Power Exchange).
Any comment:	-The same value will be applied during the first crediting period without updating. -For detail calculation method, refer to Annex 3.

CDM – Executive Board

Data / Parameter:	EF _{OM, y}
Data unit:	tCO ₂ /MWh
Description:	Operating Margin emission factor
Source of data used:	Calculated
Value applied:	0.6817 tCO ₂ /MWh
Justification of the choice of data or description of measurement methods and procedures actually applied :	This value was calculated according to “Tool to calculate the emission factor for an electricity system (version 01.1).” Applied value was calculated by referring Statistics of Electric Power in 2005-2007, KEPCO 2006-2008 and Status of Generation facility (2008) (Korea Power Exchange).
Any comment:	-This data will be calculated at the time of PDD submission and will not be changed during the first crediting period. - This value is ex-ante value which is calculated at the time of PDD submission and will be applied during the crediting period without update.

Data / Parameter:	EF _{BM, y}
Data unit:	tCO ₂ /MWh
Description:	Build Margin emission factor
Source of data used:	Calculated
Value of data	0.3933 tCO ₂ /MWh
Justification of the choice of data or description of measurement methods and procedures actually applied :	This value was calculated according to “Tool to calculate the emission factor for an electricity system (version 01.1).” Applied value was calculated by referring Statistics of Electric Power in 2005-2007, KEPCO 2006-2008 and Status of Generation facility (2008) (Korea Power Exchange).
Any comment:	-This data will be calculated at the time of PDD submission and will not be changed during the first crediting period. - This value is ex-ante value which is calculated at the time of PDD submission and will be applied during the crediting period without update.

Data / Parameter:	FC _{i,m,y}
Data unit:	mass or volume unit
Description:	Amount of fossil fuel type i consumed by power plant / unit m in year y
Source of data used:	Statistics of Electric Power in 2005-2007, KEPCO 2006-2008
Value of data	See the <Table Annex-1>
Justification of the choice of data or description of measurement methods and procedures actually applied :	Applied value was referred Statistics of Electric Power in 2005-2007, KEPCO 2006-2008.
Any comment:	- The same value will be applied during the first crediting period without updating.

CDM – Executive Board

Data / Parameter:	$NCV_{i,v}$
Data unit:	kcal/mass or volume unit
Description:	Net calorific value of fossil fuel type i consumed by power plant / unit m in year y
Source of data used:	Statistics of Electric Power in 2005-2007, KEPCO 2006-2008
Value of data	See the <Table Annex-2>
Justification of the choice of data or description of measurement methods and procedures actually applied :	Applied value refers to Statistics of Electric Power in 2005-2007, KEPCO 2006-2008.
Any comment:	<ul style="list-style-type: none"> - $NCV_{i,v}$ is the $GCV_{i,v}$ multiplied the Net caloric values conversion factor. - $GCV_{i,v}$ value refers to Statistics of Electric Power in 2005-2007, KEPCO 2006-2008 and Net caloric values conversion factor was referred 2006 IPCC Guidelines for National Greenhouse Gas Inventories. - The same value will be applied during the first crediting period without updating.

Data / Parameter:	$EF_{CO_2,i,y}$
Data unit:	tCO ₂ /TJ
Description:	CO ₂ emission factor of fossil fuel type i in year y
Source of data used:	2006 IPCC Guidelines on National GHG Inventories
Value of data	See the <Table Annex-5>
Justification of the choice of data or description of measurement methods and procedures actually applied :	IPCC default values at the lower limit of the uncertainty at 95% confidence interval as provided in table 1.4 of Chapter 1 of Vol.2(Energy)
Any comment:	<ul style="list-style-type: none"> - The same value will be applied during the first crediting period without updating.

The calculation of the OM and BM emission factors were submitted to DOE as an excel file. It's including following information:

- Information to clearly identify the plant
- The date of commissioning
- The fuel type(s) used
- The quantity of net electricity generation in the relevant year(s)
- The fuel consumption of each fuel type in the relevant year(s)
- Information of a low-cost/must-run plant

CDM – Executive Board

B.6.3 Ex-ante calculation of emission reductions:

>>

Baseline emission

The [installed wind power turbine-generator unit](#) capacity of the project is 3MW and expected electricity supplied to the grid by the project is 6,400 MWh per year.

$$\begin{aligned}
 \text{Baseline emission} &= \text{electricity supplied to the grid by the project} \times \text{emission coefficient} \\
 &= 6,400\text{MWh/yr} \times 0.6096\text{tCO}_2/\text{MWh} \\
 &= \mathbf{3,901 \text{ tonCO}_2/\text{yr}}
 \end{aligned}$$

Project emission

Project emission is zero

Ex-ante emission reduction

$$\begin{aligned}
 \text{-Emission reduction} &= \text{Baseline emission} - \text{Project emission} \\
 &= 3,901 \text{ tonCO}_2/\text{yr} - 0 \text{ tonCO}_2/\text{yr} \\
 &= \mathbf{3,901 \text{ tonCO}_2/\text{yr}}
 \end{aligned}$$

B.6.4 Summary of the ex-ante estimation of emission reductions:

>>

Year	Estimation of project activity emissions (tCO ₂ e)	Estimation of baseline emissions (tCO ₂ e)	Estimation of leakage (tCO ₂ e)	Estimation of overall emission reductions (tCO ₂ e)
Dec 2009~Nov	0	3,901	0	3,901
Dec 2010~Nov	0	3,901	0	3,901
Dec 2011~Nov 2012	0	3,901	0	3,901
Dec 2012~Nov 2013	0	3,901	0	3,901
Dec 2013~Nov 2014	0	3,901	0	3,901
Dec 2014~Nov 2015	0	3,901	0	3,901
Dec 2015~Nov 2016	0	3,901	0	3,901
Total (tonnes of CO₂e)	0	27,310	0	27,310

CDM – Executive Board

B.7 Application of a monitoring methodology and description of the monitoring plan:**B.7.1 Data and parameters monitored:**

Data / Parameter:	EGy
Data unit:	MWh
Description:	Electricity supplied to the grid by the project
Source of data to be used:	Measured
Value of data	6,400MWh/yr
Description of measurement methods and procedures to be applied:	Read from watt-hour meter.
QA/QC procedures to be applied:	<ul style="list-style-type: none"> - Uncertainty of data is low - QA/QC procedure for this is planned. - The allowable error of data must be within $\pm 0.5\%$. - <u>Regarding the imported electricity meter, its allowable error must be within $\pm 1.0\%$.</u>
Any comment:	<ul style="list-style-type: none"> - Data will be measured hourly and recorded monthly. - Data will be kept for two years after the last issuance of CERs for the project activity. - Data will be aggregated weekly, monthly and yearly - Measured data will be double checked against receipt of sales - This data is electricity generated except electricity consumed in the plant and electricity imported for the project activity.

Quality control (QC) and quality assurance (QA) procedures*1. Monitoring equipment*

- 1-1. Electricity measuring meters shall be set up transparently in accordance with “Law regarding measurement” and “Act on operation of electricity market” and shall be sealed after affirmation of Korea Power Exchange.
- 1-2. Meters shall be approved through the certified official process (the valid period for the authorized certification: 7 years.)
- 1-3. Meters shall be calibrated when they are installed, and re-calibrated every three years after installation regularly.

2. Measure & Archive

- 2-1. Amount of electricity that has transmitted to the grid shall be measured automatically by established meters. The measured data are simultaneously transferred to Hydroelectric Power Plant and Korea Power Exchange.
- 2-2. Amount of electricity that has measured shall be collected daily, weekly, and monthly and shall be archived in electronic way.
- 2-3. The collected data in article 2-2. shall be compared with those of Korea power Exchange.
- 2-4. If two data compared in article 2-3. is different, the operation condition of electricity meters and other equipments shall be examined. In case meters are improperly operated, internal audits and

CDM – Executive Board

correction procedure shall be implemented and be certified by the final decision-maker and Korea Power exchange.

3. Management of monitoring and electricity safety

3-1. Person in charge of monitoring and electricity safety shall attend the following courses once every three years. three times per year.

Course on 'Law regarding measurement'

Course on 'Act on operation of electricity market'

Course on Electricity safety

The course on 'Act on operation of electricity market' shall be attended once in case of replacing the person in charge of monitoring and electricity safety.

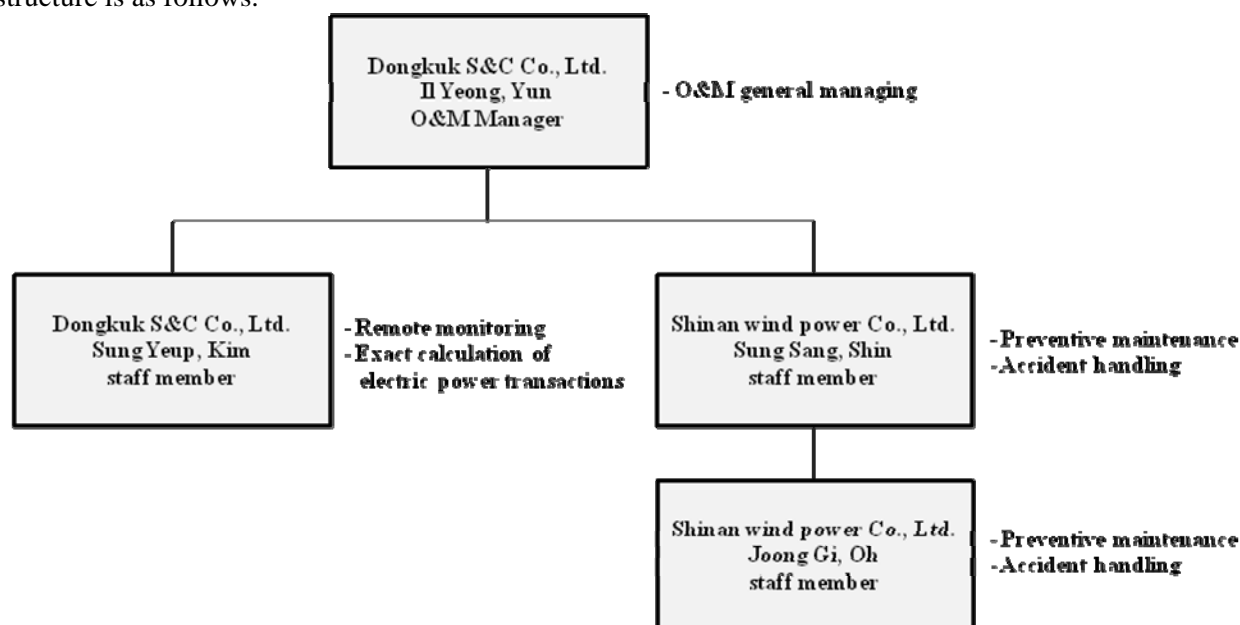

3-2. In case of absence of the responsible person, the second responsible person shall be selected.

3-3. If responsibility for monitoring and electricity safety is transferred to another person, it need to have approval by the final decision-maker.

B.7.2 Description of the monitoring plan:

>>

Applied monitoring methodology for the project is AMS I.D. and electricity produced will be monitored. Also, related facility including watt-meter will be managed properly. Operational and management structure is as follows.

[Figure 7] The operational and management structure

When accident occurs, accident alarm will be sent to the personal mobile phone by internet phone service.

B.8 Date of completion of the application of the baseline and monitoring methodology and the name of the responsible person(s)/entity(ies)

>>

- Date of completion of the application of the methodology

: 01/08/2008

- Responsible person/entity

: Mr. Pyo, Jeong-gwan / Ecoeye Co., Ltd

CDM – Executive Board

SECTION C. Duration of the project activity / crediting period**C.1 Duration of the project activity:****C.1.1. Starting date of the project activity:**

>>

Starting date of the project is 20/08/2008.

The starting date of CDM project activity is the earliest date at which either the implementation or construction or real action of a project activity begins.

In light of the above definition, the start date shall be considered to be the date on which the project participant has committed to expenditures related to the implementation or related to the construction of the project activity. This, for example, can be the date on which contracts have been signed for equipment or construction/operation services required for the project activity.

In case of the project, therefore, the date (20/08/2008) which contract has been signed for equipment and construction can be starting date of CDM project activity. And it is most applicable to definition of 'Glossary of CDM terms'.

Date	Facts of the project
14/07/2008	- 3MW Shian wind power CDM project registration consulting contract with ECOEYE. Co., Ltd
20/08/2008	- Contract with Dongkuk S&C Co., Ltd. for 3MW Shian wind power construction work including equipment supply - Start of construction work on wind power plant
01/10/2008	- Contract with KEPCO(Korean Electricity Power Corporation) for use of power distribution equipment
07/10/2008	- Start of construction work on the office of wind power plant

C.1.2. Expected operational lifetime of the project activity:

>>

Expected operational lifetime of the project activity is 20years.

C.2 Choice of the crediting period and related information:**C.2.1. Renewable crediting period****C.2.1.1. Starting date of the first crediting period:**

>>

01/12/2009 or Registration date whatever is later.

C.2.1.2. Length of the first crediting period:

>>

7years

CDM – Executive Board

C.2.2. Fixed crediting period:**C.2.2.1. Starting date:**

>>N/A

C.2.2.2. Length:

>>N/A

SECTION D. Environmental impacts

>>

D.1. If required by the host Party, documentation on the analysis of the environmental impacts of the project activity:

>>

According to the “Environmental Impact Assessment Act”, one of the laws in Korea, the proposed project activity does not need to environmental impact assessment.

If any power plant using solar, wind or fuel cell as a power source has the design capacity over than 100,000kW, the environmental impacts induced by such a plant have to be estimated, in accordance with the “Environmental Impact Assessment ACT.

In the project case, the design capacity of installed wind power turbine-generator unit is planned as just 3MW, which is much less amount than the lowest limit capacity, 100,000kW. Therefore, It is not necessary for the project to perform obligatory ‘environmental impacts assessment (EIA)’ in conformity with the legal restriction

D.2. If environmental impacts are considered significant by the project participants or the host Party, please provide conclusions and all references to support documentation of an environmental impact assessment undertaken in accordance with the procedures as required by the host Party:

>>

N/A

SECTION E. Stakeholders’ comments

>>

E.1. Brief description how comments by local stakeholders have been invited and compiled:

>>

Stakeholders of the project are local residents, Jeollanam-do provincial government, Korean Power Exchange and Korean Electricity Power Corporation.

The process getting comments

1) Written consent by local residents

The project participant has explained about wind farm to local residents in order to help in resident’s understanding. (10/04/2008) Also PP gave chance to pay a visit of inspection to Youngduk Wind Park to local residents. (23/04/2008)

After PP’s presentation and field trip to Youngduk, local residents held the general meeting without Shinan officials. And they agreed with this wind power project construction. (29/04/2008)

CDM – Executive Board

Date	Facts of the project
10/04/2008	<p>- Presentation on the project to the local residents</p> 
23/04/2008	<p>- Local residents visit of inspection to Youngduk Wind Park</p> 
29/04/2008	<p>- Held the general meeting of local residents</p> <p>- Local residents drew up the written consent on this wind power project construction.</p> 

2) Request for permission relative to the project

CDM – Executive Board

The organizations like a Jeollanam-do provincial government, Korean Power Exchange and Korean Electricity Power Corporation issue the permission when project participant satisfied their terms.

E.2. Summary of the comments received:

>>

Stakeholder	How to invite and compile comments
Local Residents	There is no special comment.
Jeollanam-do provincial government	There is no special comment. And the Electric Enterprise permit was issued.
Korean Power Exchange	There is no special comment. And they approved that PP can synchronize.
Korean Electricity Power Corporation	There is no special comment. And they accept PP using the power distribution equipment.

* We submitted documents to DOE.

E.3. Report on how due account was taken of any comments received:

>>

There are no special comments.

<Table Annex-5> Fuels CO₂ Emission factor

Fuel Type	EF_{CO₂,i,y} (tCO₂/TJ)
Gasoline	67.5
Diesel oil	72.6
residual fuel oil	75.5
LNG	54.3
bituminous coal	89.5
Anthracite	94.6
