

UNFCCC Clean Development Mechanism Monitoring Report

***Transalloys Manganese Alloy Smelter Energy Efficiency Project***

*Version 5*

CDM registration number 1027

Monitoring period 01/10/04 – 31/03/08

Document ID: CDM1027-M1

Date: 05 September 2008

## Project background

Transalloys Manganese Alloy Smelter Energy Efficiency Project has been registered as CDM project by the UNFCCC on 19 October 2007 under reference number 1027.

Further background on this project can be found in the PDD and associated documents, which are available on the UNFCCC website:

<http://cdm.unfccc.int/Projects/DB/DNV-CUK1174913531.12/view.html>

Parties involved are South Africa (Host Country) and the United Kingdom of Great Britain and Northern Ireland (other Parties). The project participants are

Name of party involved (*) ((host) indicates a host party) Private and/or public entity(ies)	Project participants (*) (as applicable)	Kindly indicate if the party involved wishes to be considered as project participant (Yes/No)
South Africa(host)	Highveld Steel and Vanadium Corporation Limited	No
United Kingdom of Great Britain and Northern Ireland	EcoSecurities Group Plc	No

## Monitoring background

Basis for the calculation of emission reductions is the monitoring plan in the Project Design Document (PDD). The calculation of emission reduction in the PDD applied methodologies ACM0002 (version 6 of 19/05/2006) and AM0038 (version 1 of 29/09/06).

There are no remaining open issues related to monitoring after completion of project validation.

## Monitoring results

### Emission reduction

The calculated emission reductions amount to **223,073 ton CO<sub>2</sub>eq.**

### Monitoring period covered

This is the first monitoring report of this project. It covers the period 01/10/2004 to 31/03/08.

### **Presentation of monitoring results – spreadsheet**

All monitoring data has been included in an Excel workbook per furnace. As there are 3 furnaces in the project so far there are 3 workbooks. The workbook includes:

1. CER Summary: States emission reductions for all furnaces over the entire monitoring period.
2. Overview: Provides project details.
3. F# (furnace ref number: 3, 5 or 7) - Historic & Baseline: Outlines the historic data inputs and baseline emissions calculation.
4. F# (furnace ref number: 3, 5 or 7) – Compositions: Provides details regarding the compositions of various raw materials.
5. F# (furnace ref number: 3, 5 or 7) – Raw & processed data: Contains all monitored data obtained from the site.
6. F# (furnace ref number: 3, 5 or 7) – Project emissions & ER: Outlines the project emissions calculation with raw data inputs and references to data sources. Also states the net emission reduction for the particular furnace.

### **Calculation methodology**

The calculation methodology of emission reductions for this project is summarised below. Please note that data and calculations are cross-checked in order to assure quality.

Calculation was carried out as detailed in the following steps for the data generated:

#### **A. Worksheet *F# (furnace ref number: 3, 5 or 7) - Historic & Baseline:***

1. All monitored data from 1997 to 2003 (7 years) is copied into a table. The data is tons of SiMn produced per year, electricity, coal, coke, paste consumed per year, coke fixed carbon and coke percent volatiles;
2.  $QP_{\text{historic}}$  is calculated as the average SiMn produced per year over the period 1997 to 2003;
3.  $sec_b$  is calculated as the ratio of the electrical consumption to SiMn consumption over 1997 to 2003;
4.  $EF_{b, \text{coal}}$  is the baseline emission factor for coal and is taken as a fixed value from IPCC;

5.  $EF_{b, coke}$  (baseline emission factor for coke) is determined by summing the monitored coke fixed carbon content and the product of the monitored volatiles % in coke and the IPCC value of carbon % in volatiles per year; this value is then multiplied by the weight ratio of a mole of CO<sub>2</sub> over a mole of C, and averaged over the 1997 to 2003 period;
6.  $EF_{b, paste}$  (baseline emission factor for paste) is calculated by adding the paste fixed carbon (from supplier specifications) and the product of the volatiles % (from supplier specifications) with carbon % in volatiles (from IPCC for coke as paste has a very similar composition to coke);
7.  $EF_{y, offset}$  is the grid CEF and has been established on the basis of ACM0002 v6 and is stated in the PDD;
8.  $QP_{y, max}$  is the SiMn produced at year y and is selected as the smaller figure (i.e. more conservative) between year y SiMn production and  $QP_{historic}$  (see step 2). If at year y the furnace has functioned less than 12 months, a factor is introduced to  $QP_{historic}$  to correspond to the activity period within year y;
9.  $BE_{y, offsite}$  (offsite baseline emissions) are the product of  $QP_{y, max}$  (step 8),  $EF_{y, offset}$  (step 7) and  $sec_b$  (step 3);
10.  $EF_{b, onsite}$  (onsite baseline emission factor) is the sum of the products of the emission factors for coal, coke and paste and their respective consumptions, divided by the overall SiMn production over the period 1997 to 2003;
11.  $BE_{y, onsite}$  (onsite baseline emissions) in year y are the product of  $EF_{b, onsite}$  (step 10) and  $QP_{y, max}$  (step 8);
12.  $BE_y$  (overall baseline emissions) are the sum of  $BE_{y, onsite}$  (step 11) and  $BE_{y, offsite}$  (step 9);

**B. Worksheet F# (furnace ref number: 3, 5 or 7) – Project Emissions & ER:**

1. All monitored data for the monitoring period is entered into a table. The data is tons of SiMn produced per year [ $QP_{y, monitored}$ ], electricity [ $EC_y$ ] (which has been corrected for drift where applicable), coal [ $Q_{p, coal, y}$ ], coke [ $Q_{p, coke, y}$ ], paste [ $Q_{p, paste, y}$ ] consumed per year, coke fixed carbon and coke percent volatiles. This data is taken from the daily measurements in worksheet F# (furnace ref number: 3, 5, or 7)- Raw & processed data;

2.  $sec_{p, y}$  is calculated as the ratio of the electrical consumption to SiMn consumption at year  $y$ ;
3.  $EF_{p, coal, y}$  is the project emission factor for coal and is taken as a fixed value from IPCC.  
Note: As stated in the PDD, taking project-specific values for  $EF_{p, coal, y}$  would not be conservative as shown in the Total carbon (coal) in tab “F# - Project Emissions & ER”.
4.  $EF_{p, coke, y}$  (project emission factor for coke) is calculated by summing from each lab analysis report in a year (see worksheet *F# (furnace ref number: 3, 5, or 7)- Raw & processed data*) the monitored coke fixed carbon and the product of the monitored volatiles % in coke (same source as for the fixed carbon) and the IPCC value of carbon % in volatiles; this value is then multiplied by the weight ratio of a mole of CO<sub>2</sub> over a mole of C;
5.  $EF_{p, paste, y}$  (project emission factor for paste) is taken as stated in AM0038 v2, that is, 3.67 tCO<sub>2</sub>/t of carbon paste. This conservative default value suggested in the methodology AM0038 is a more conservative factor (+10% more) than the value suggested in the PDD (3.32 tCO<sub>2</sub>/t) because the project-specific value was not available monthly.
6.  $EF_{y, offset}$  is the grid CEF and has been established on the basis of ACM0002 v6 and is stated in the PDD (same as in the baseline);
7. Quality of coal<sub>p</sub> and Quality of coke<sub>p</sub> are monitored with lab analyses monthly to ensure consistency;
8. Quality of electrode paste<sub>p</sub> was established once at the time of contracting the supplier. It is produced to the contractual specifications, thus assuring the consistency of the composition;
9. Quality of SiMn<sub>p</sub> produced at the relevant furnace is analysed daily to ensure that the quality remains consistent;
10. Quality of Ore and Quality of fluxes are monitored monthly;
11.  $QP_{y, max}$  is the SiMn produced at year  $y$  and is selected as the smaller figure (i.e. more conservative) between year  $y$  SiMn production and  $QP_{historic}$  (see baseline, step 2). If at year  $y$  the furnace has functioned less than 12 months, a factor is introduced to  $QP_{historic}$  to correspond to the activity period within year  $y$ ;

12.  $PE_{y, \text{offsite}}$  (offsite project emissions) are the product of  $QP_{y, \text{max}}$  (step 7),  $EF_{y, \text{offset}}$  (step 6), and  $sec_{p, y}$  (step 2);
13.  $EF_{p, y, \text{onsite}}$  (onsite project emission factor) is the sum of the products of the emission factors for coal, coke and paste and their respective consumptions, divided by  $QP_{y, \text{monitored}}$  i.e. the amount of SiMn production at year y;
14.  $PE_{y, \text{onsite}}$  (onsite project emissions) in year y are the product of  $EF_{p, y, \text{onsite}}$  (step 9) and  $QP_{y, \text{max}}$  (step 7);
15.  $PE_y$  (overall project emissions) are the sum of  $PE_{y, \text{onsite}}$  (step 10) and  $PE_{y, \text{offsite}}$  (step 8);
16.  $ER_y$  (net emission reductions before adjustment) at year y are the difference between  $BE_y$  and  $PE_y$ ;
17.  $ER_{y, \text{onsite}}$  is calculated as  $BE_{y, \text{onsite}}$  (step A. 11.) subtracted by  $PE_{y, \text{onsite}}$  (step B. 14.);

#### C. Worksheet *CER Summary*:

1. The Furnace specific yearly emission reductions are added to show overall yearly emission reduction (before adjustment);
2. The Furnace specific yearly onsite emission reductions are added to show overall yearly onsite emission reduction;
3. As per PDD, if  $ER_{y, \text{onsite}}$  for a particular year is positive, a discount factor of 9% of onsite emission reduction is subtracted to  $ER_y$  for the respective year.

Total uncertainty adjusted net emission reductions for the specified time frame are thus determined and included in the monitoring report.

N.B. Please note that in some years negative emissions reductions occurred at Furnace 5. This is mainly due to the new design being less efficient than expected. Moreover, due to the innovativeness of this project, failures of the furnace were quite common leading to shut-down periods for repair and maintenance. Frequent shut-downs and re-starts can contribute to an overall lower average efficiency.

**Table 1 – Baseline and project emissions for Furnace 3**
